 **SMT-Figure 1.** Estimated landings (t) of small tunas (combined) in the Atlantic and Mediterranean, 1950-2016. The data for the last three years are incomplete.

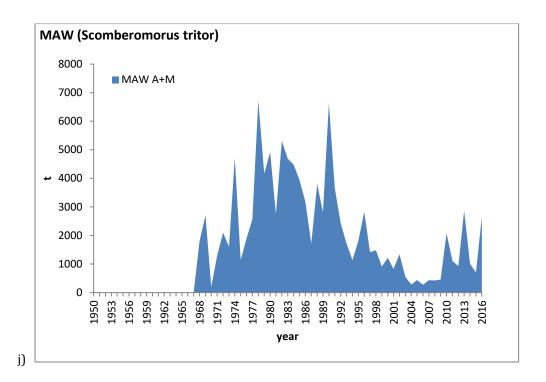

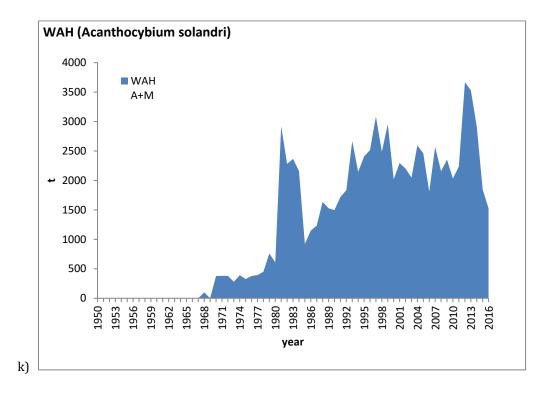

**SMT-Figure 2.** Estimated landings (t) of the major species of small tunas in the Atlantic and Mediterranean, 1950-2016. The data for the last years are incomplete.

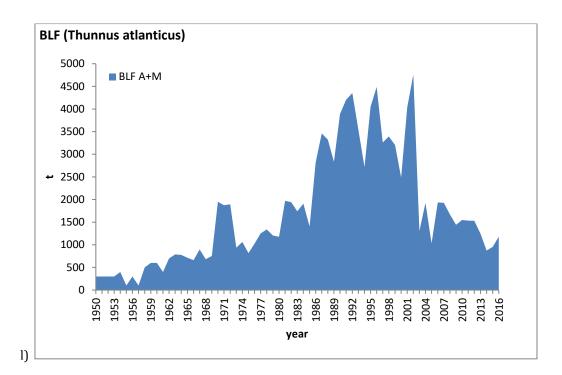

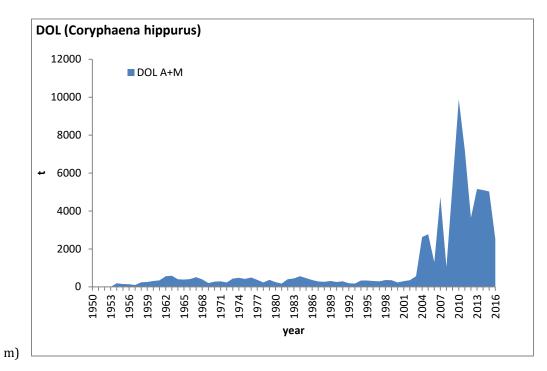

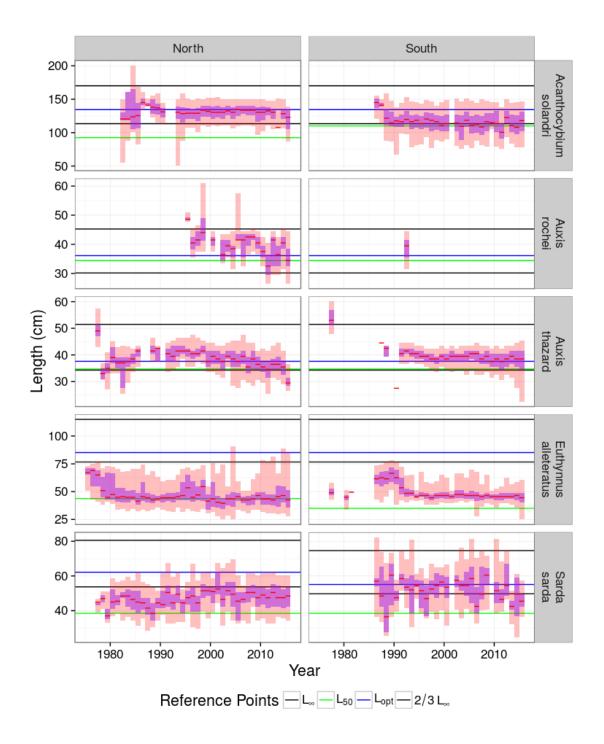

**SMT-Figure 2.** Estimated landings (t) of the major species of small tunas in the Atlantic and Mediterranean, 1950-2016. The data for the last years are incomplete.

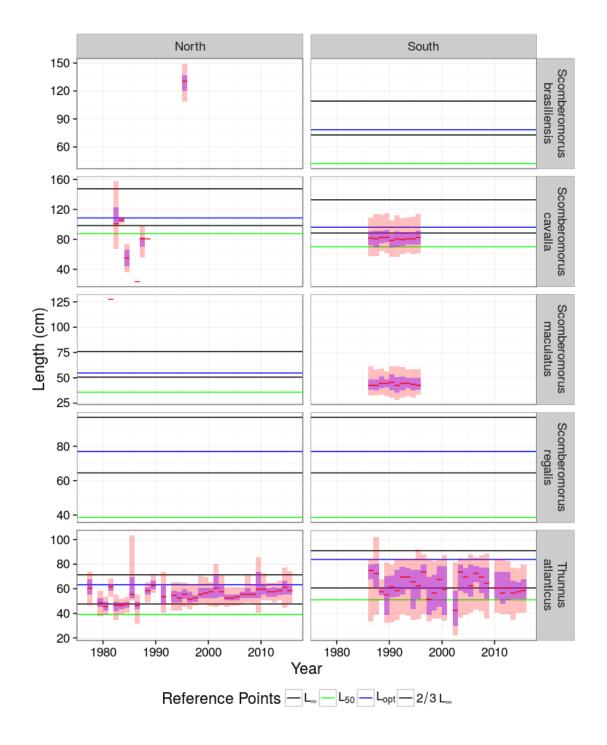

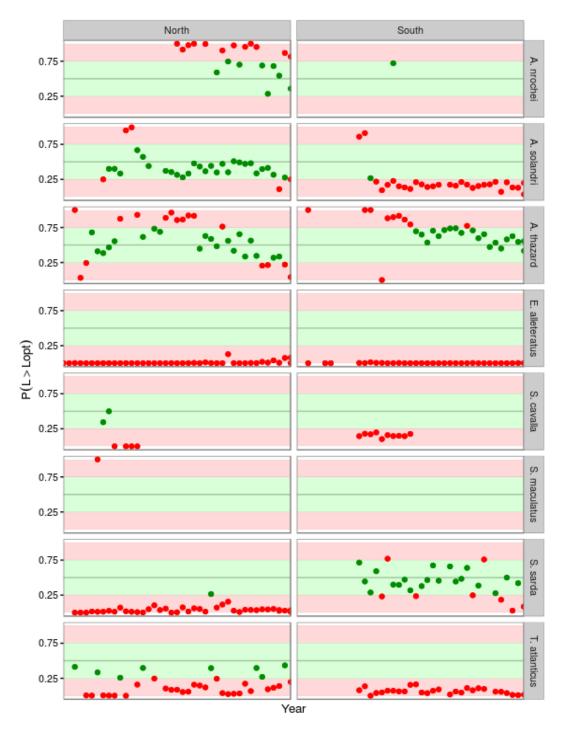

**SMT-Figure 2.** Estimated landings (t) of the major species of small tunas in the Atlantic and Mediterranean, 1950-2016. The data for the last years are incomplete.

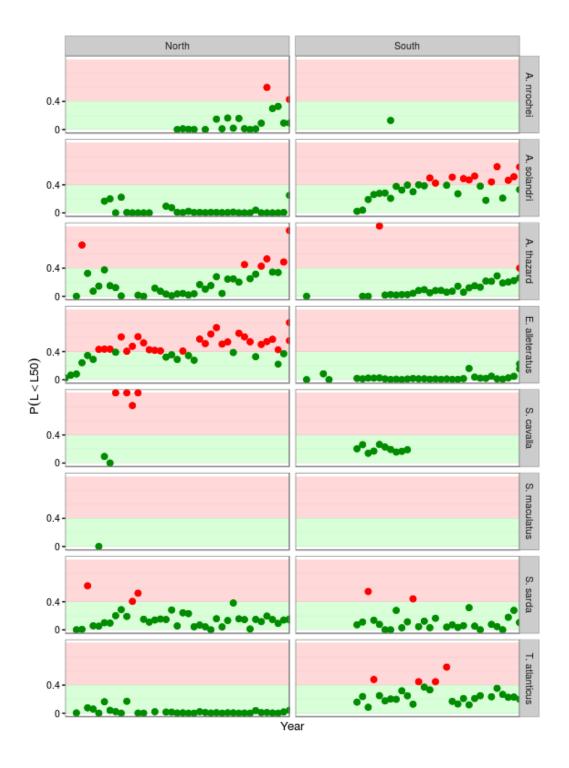

**SMT-Figure 3a.** Length distributions and reference points by species and Atlantic region for version 4 of Task II size data. The horizontal lines show the reference points i.e. asymptotic length  $(L_{\infty})$ , length at 50% mature  $(L_{50})$  and two estimates of the size at which a cohort reaches its maximum biomass  $(L_{opt})$  and its proxy  $(2/3 \sim L_{\infty})$ . The bars show the length distributions, i.e. median, interquartiles (5%, 95%).

**SMT-Figure 3b.** Length distributions and reference points by species and Atlantic region for version 4 of Task II size data. The horizontal lines show the reference points i.e. asymtopic length  $(L_{\infty})$ ), length at 50% mature  $(L_{50})$  and two estimates of the size at which a cohort reaches its maximum biomass  $(L_{opt})$  and its proxy  $(2/3 \sim L_{\infty})$ . The bars show the length distributions, i.e. median, interquartiles (5%, 95%).

**SMT-Figure 4a.** Proportion of length distributions greater than  $L_{opt}$  by species and Atlantic region. 50 is used as a target reference point and so catches where the proportions of individuals greater than  $L_{opt}$  is >25% and <75% are coloured green.

**SMT-Figure 4b.** Proportion of length distributions less than L50 by species and Atlantic region; 40% is used as a limit reference point and so when the proportion of individuals less than L50 is >40% is coloured red.

#### 8.13 SHK – SHARKS

Two intersessional meetings (a data preparatory and a stock assessment meeting) were conducted in 2017 for North and South Atlantic shortfin mako (*Isurus oxyrinchus*) stocks. Both meetings were held in Madrid, Spain, 28-31 March and 12-16 June. Information about the status of the blue shark (*Prionace glauca*) is available in the 2015 report of the assessment, while information about the status of the porbeagle (*Lamna nasus*) stock is available in the SCRS 2009 report of the assessment of that species. An Ecological Risk Assessment had also been conducted for 16 shark species (20 stocks), which is detailed in the 2013 report of the Sharks Working Group.

#### SHK-1. Biology

A great variety of shark species are found within the ICCAT Convention area, from coastal to oceanic species. Biological strategies of these sharks are very diverse and are adapted to the needs within their respective ecosystems where they occupy a very high position in the trophic chain as active predators. Therefore, generalization as regards to the biology of these very diverse species results in inevitable inaccuracies, as would occur for teleosts. To date, ICCAT has prioritized the biological study and assessment of the major sharks of the epipelagic system as these species are more susceptible to being caught as by-catch by oceanic fleets targeting tuna and tuna-like species. Among these shark species there are some of special prevalence and with an extensive geographical distribution within the oceanic-epipelagic ecosystem, such as the blue shark and shortfin mako shark, and others with less or even limited prevalence, such as porbeagle, hammerhead sharks, thresher sharks, and white sharks.

Blue shark, shortfin mako and porbeagle are large pelagic sharks that show a wide geographic distribution; the first two from tropical to temperate waters worldwide, while the porbeagle has a distribution associated with cold-temperate waters. Shortfin mako and porbeagle have an aplacental viviparity with an oophagy reproductive system, which decreases their fecundity but increases the probability of survival of their young. The blue shark is placental viviparous and has an average litter size of 35 individuals, while the shortfin mako has an average litter size of around 12 and the porbeagle a litter size of usually just four individuals. Although high uncertainty regarding their biology remains, available life history traits (slow growth, late maturity and small litter size) indicate that they are vulnerable to overfishing. A behavioral characteristic of these species is their tendency to segregate temporally and spatially by size-sex, during feeding, mating-reproduction, gestation and birth processes. Tagging studies have suggested that they exhibit large-scale migratory behaviour and periodic vertical movement, but the lack of information on some components of the populations precludes a complete understanding of their distribution/migration pattern by ontogenetic stages and in some cases identifying their pupping/mating grounds. Numerous aspects of the biology of these species are still poorly understood or completely unknown, particularly for some regions, which contributes to increased uncertainty in quantitative and qualitative assessments.

#### SHK-2. Fishery indicators

Earlier reviews of the shark database resulted in recommendations to improve data reporting on shark catches. Though global statistics on shark catches included in the database have improved, they are still insufficient to permit the Committee to provide quantitative advice on stock status for most stocks with sufficient precision to guide fishery management toward optimal harvest levels. While reported and estimated catches for blue shark, shortfin mako and porbeagle are still generally subject to higher levels of uncertainty than the major tuna stocks, they have been considered sufficiently complete for the purpose of quantitative stock assessment, and are provided in **SHK-Table 1** and **SHK-Figures 1 and 2**.

Multiple standardized CPUE data series for blue shark were used in 2015 for both the North and South Atlantic stocks. For the North Atlantic stock, the eight indices of abundance used were: US longline observer, Japanese longline (early and late), U.S. observer cruise, Portuguese longline, Venezuelan longline, Spanish longline, and Chinese Taipei longline; for the South Atlantic stock, the six indices used were: Brazilian longline, Chinese Taipei longline, EU-Spain longline, Japanese longline (early and late) and Uruguayan longline. For both stocks, the series were generally flat or showed increasing trends, which conflicted with the also increasing catch tendencies, especially for the South Atlantic stock (SHK-Figure 3).

The CPUE series available for the 2017 shortfin mako stock assessments showed decreasing trends since approximately 2010 for the North Atlantic stock and generally increasing trends since approximately 2008 for the South Atlantic stock. (SHK-Figures 4-5). For each stock, the CPUE series generally showed a trend similar to that of the catches, particularly the South Atlantic stock, which could be problematic for the stock assessments based on production models.

During the porbeagle assessment in 2009, standardized CPUE data were presented for three of the four stocks (NE, NW and SW) (**SHK-Figure 6**). These series when referring to fisheries targeting porbeagle may not reflect the global abundance of the stock and where they refer to sharks caught as by-catch they could be highly variable. In 2010, only new information from the Japanese longline fleet on the CPUE of shortfin mako and porbeagle was presented.

With regard to the 16 species (20 stocks) included in the 2012 ERA, the Committee believes that, in spite of existing uncertainties, results are more robust than those obtained in the 2008 ERA. With this information the Committee considers it easier to identify those species that are most vulnerable to prioritize research and management measures (**SHK-Table 2**). These ERAs are conditional on the biological parameters used to estimate productivity as well as the susceptibility values for the different fleets. The committee highlights the higher participation of scientists from diverse CPCs, who provided valuable data for this ERA.

## SHK-3. State of the stocks

Stock assessments and Ecological Risk Assessments carried out for elasmobranchs within the ICCAT Convention area have focused only on Atlantic stocks, and not on shark stocks in the Mediterranean Sea, to date. The 2012 ERA conducted by the Committee was a quantitative assessment consisting of a risk analysis to evaluate the biological productivity of these stocks and a susceptibility analysis to assess their propensity to capture and mortality in pelagic longline fisheries. Three metrics were used to calculate vulnerability (Euclidean distance, a multiplicative index, and the arithmetic mean of the productivity and susceptibility ranks). The five stocks with the lowest productivity were the bigeye thresher (Alopias superciliosus), sandbar (Carcharhinus plumbeus), longfin mako (Isurus paucus), night (Carcharhinus signatus), and South Atlantic silky shark (Carcharhinus falciformis). The highest susceptibility values corresponded to shortfin mako (Isurus oxyrinchus), North and South Atlantic blue sharks (Prionace glauca), porbeagle (Lamna nasus), and bigeye thresher. Based on the results, the bigeye thresher, longfin and shortfin makos, porbeagle, and night sharks were the most vulnerable stocks. In contrast, North and South Atlantic scalloped hammerheads (Sphyrna lewini), smooth hammerhead (Sphyrna zygaena), and North and South Atlantic pelagic stingray (Pteroplatytrygon violacea) had the lowest vulnerabilities. The Committee observed that the data regarding night shark distribution was considered to be incomplete and therefore the results with regard to this species should be considered preliminary and requiring revision before publication.

## SHK-3.1 Blue shark

Considerable progress was made on the integration of new data sources, in particular size data, and modelling approaches, particularly model structure, in the 2015 assessment of the status of the stock of North Atlantic blue shark. For both the North and South Atlantic stocks, uncertainty in data inputs and model configuration was explored through sensitivity analysis. Although sensitivity analyses did not cover the full range of possible uncertainty, they revealed that results were sensitive to structural assumptions of the models. All the production model formulations had difficulty fitting the flat or increasing trends in the CPUE series combined with increasing catch trends. Overall, assessment results were uncertain (e.g. the level of absolute abundance varied by an order of magnitude between models with different structures) and should be interpreted with caution.

For the North Atlantic stock, all scenarios considered with the Bayesian surplus production model and the integrated model (SS3) indicated that the stock was not overfished and that overfishing was not occurring, as was also concluded in the 2008 stock assessment (SHK Figure 7). However, the Committee acknowledged that there still remained a high level of uncertainty in data inputs and model structural assumptions, by virtue of which the possibility of the stock being overfished and overfishing occurring could not be ruled out. The Committee identified a better definition of fleets for SS3 and a more in depth historical catch reconstruction, especially discard estimates, as some of the main sources of uncertainty that may help to improve model fit and provide a more certain stock status in the future.

For the South Atlantic stock, all scenarios with the Bayesian surplus production model estimated that the stock was not overfished and that overfishing was not occurring, as concluded in the 2008 stock assessment. Estimates obtained with the Bayesian state-space surplus production model formulation should be considered more reliable than other Bayesian production models. These were less optimistic, predicting that the stock could be overfished and overfishing could be occurring (**SHK Figure 8**). Acknowledging the high uncertainty of the results, the Committee cannot rule out that the stock is overfished and experiencing overfishing.

# SHK-3.2 Shortfin mako shark

The 2017 assessment of the status of North and South Atlantic stocks of shortfin mako shark was conducted with updated time series of relative abundance and annual catches (C1), life history, and with the inclusion of length composition data. An alternative series of catch data based on ratios of shark catches to catches of the main target species (C2) was also estimated and used in the assessments. The results obtained in this evaluation are not comparable to those obtained in the last assessment conducted in 2012 because the input data and model structures have changed significantly: the catch time series are different (1950-2015 for the 2017 assessment and 1971-2010 for the 2012 assessment) and were derived using different assumptions; the CPUE series in the North have been decreasing since 2010 (the last year in the 2012 assessment models); some of the biological inputs have changed (growth curve, natural mortality at age) and some are now sex specific for the North; with the new biological inputs the intrinsic rate of population growth (rmax) for the North Atlantic used to construct prior distributions is now about half that used in the 2012 assessment; and additional length composition data also became available for the North. Additionally, in 2012 only a Bayesian production model (BSP1) and a catch-free age-structured production (CFASPM) model were used, whereas more modeling platforms that more fully use the data available were explored in the current assessment (BSP2]AGS [Just Another Gibbs Sampler emulating the Bayesian production model], JABBA [Just Another Bayesian Biomass Assessment], CMSY [Catch at MSY], and SS3 [Stock Synthesis 3]). It is the Committee's view that the 2017 stock assessment represents a significant improvement in our understanding of current stock status, for North Atlantic shortfin mako in particular.

For the North Atlantic stock, results of nine stock assessment model runs were selected to provide stock status and management advice. Although all results indicated that stock abundance in 2015 was below  $B_{MSY}$ , results of the production models (BSP2JAGS and JABBA) were more pessimistic (B/B<sub>MSY</sub> deterministic estimates ranged from 0.57 to 0.85) and those of the age-structured model (SS3), which indicated that stock abundance was near MSY (SSF/SSF<sub>MSY</sub> = 0.95 where SSF is spawning stock fecundity), were less pessimistic. F was overwhelmingly above  $F_{MSY}$  (**SHK-Figure 9**), with a combined 90% probability from all the models of being in an overfished state and experiencing overfishing (**SHK-Figure 10**).

For the South Atlantic stock, 4 assessment model runs (2 BSP2JAGS runs and 2 CMSY runs) were considered to provide stock status and management advice. The combined probability of the stock being overfished was 32.5% and that of experiencing overfishing was 41.9% (SHK-Figure 11). The combined probabilities from all the models of being in the red, yellow, and green quadrants of the Kobe plot are provided in SHK-Figure 12. Based on the diagnostics of model performance, the estimates of unsustainable harvest rates appear to be fairly robust at this stage whereas the biomass depletion and B/B<sub>MSY</sub> estimates must be treated with extreme caution. The Committee considers results for the South Atlantic to be highly uncertain owing to the conflict between catch and CPUE data.

# SHK-3.3 Porbeagle shark

In 2009, the Committee attempted an assessment of the four porbeagle stocks in the Atlantic Ocean: Northwest, Northeast, Southwest and Southeast. In general, data for Southern hemisphere porbeagle are too limited to provide a robust indication on the status of the stocks. For the Southwest, limited data indicate a decline in CPUE in the Uruguayan fleet, with models suggesting a potential decline in porbeagle abundance to levels below MSY and fishing mortality rates above those producing MSY (**SHK-Figure 13**). But catch and other data are generally too limited to allow definition of sustainable harvest levels. Catch reconstruction indicates that reported landings grossly underestimate actual landings. For the Southeast, information and data are too limited to assess their status. Available catch rate patterns suggest stability since the early 1990s, but this trend cannot be viewed in a longer term context and thus are not informative on current levels relative to B<sub>MSY</sub>.

The Northeast Atlantic stock has the longest history of commercial exploitation. A lack of CPUE data for the peak of the fishery adds considerable uncertainty in identifying the status relative to virgin biomass. Exploratory assessments indicate that biomass is below  $B_{MSY}$  and that recent fishing mortality is near or above  $F_{MSY}$  (SHK-Figure 14). Recovery of this stock to  $B_{MSY}$  under no fishing mortality is estimated to take ca. 15-34 years. The 2009 EU TAC of 436 t in effect for the Northeast Atlantic may have allowed the stock to remain stable, at its depleted biomass level, under most credible model scenarios. Since 2010 the EU TAC has been set at zero.

The Canadian assessment of the Northwest Atlantic porbeagle stock indicated that biomass is depleted to well below  $B_{MSY}$ , but recent fishing mortality is below  $F_{MSY}$  and recent biomass appears to be increasing. Additional modelling using a surplus production approach indicated a similar view of stock status, i.e. depletion to levels below  $B_{MSY}$  and fishing mortality rates also below  $F_{MSY}$  (SHK-Figure 15). The Canadian assessment projected that with no fishing mortality, the stock could rebuild to  $B_{MSY}$  level in approximately 20-60 years, whereas surplus-production based projections indicated 20 years would suffice. Under the Canadian strategy of a 4% exploitation rate, the stock was expected to recover in 30 to 100+ years according to the Canadian projections.

During the 2009 porbeagle assessment, both porbeagle stocks in the northwest and northeast Atlantic were estimated to be overfished, with the northeastern stock being more highly depleted. In addition, porbeagle received a high vulnerability ranking in the 2008 and 2012 ERAs. The main source of fishing mortality on these stocks was from directed porbeagle fisheries which are not under the Commission's direct mandate.

# SHK-4. Outlook

# SHK-4.1 Blue shark

Due to the difficulty of determining current status for both the North and South Atlantic stocks of blue shark, in particular absolute population abundance, the Committee in 2015 considered that it was not appropriate to conduct quantitative projections of future stock condition based on the range of scenarios considered at the stock assessment meeting.

### SHK-4.2 Shortfin mako

For shortfin mako, projections could only be carried out with the BSP2JAGS production model for the North Atlantic and no projections could be conducted for the South Atlantic due to the uncertainty in stock status. Projections indicated that current catch levels (3,600 t for the Task I catches [C1] and 4,750 t for the alternative catches estimated based on ratios [C2], mean of 2011-2015) in the North Atlantic will cause continued population decline and that catches would need to be 1,000 t or lower to prevent further population declines (**SHK-Figure 16**). However, the Kobe II strategy matrices showed that for a constant annual catch of 1,000 t, the probability of being in the Kobe plot green zone would only be 25% by 2040 (**SHK-Table 3**). The Committee notes that the Kobe II strategy matrices may not reflect the full range of uncertainty in the outlook because projections were not carried out with SS3 due to technical reasons and because the model is still under development. Although in terms of current stock size the SS3 model is more optimistic than the aggregated biomass dynamic (production) models, the future outlook is probably more pessimistic because the fisheries are removing mostly juveniles and thus it can be anticipated that spawning stock size will keep declining for years after fishing pressure has been reduced until recruits reach maturity. It should be noted that ICCAT fisheries are not removing mature females.

### SHK-4.3 Porbeagle

Projections for porbeagle were not conducted in the 2009 assessment because of the great uncertainty in determining stock status for any of the stocks.

# SHK-5. Effect of current regulations

The Commission adopted Rec. 16-12, which in paragraph 2 establishes a catch limit for blue sharks in the North Atlantic (39,102 t as the average of two consecutive years). At present, the Committee is not in a position to assess the effect of this measure because the recommendation only came into effect in 2017. However, the Committee noted that the preliminary catch in 2016 was 42,117 t.

In 2013 Uruguay prohibited retention of porbeagle sharks and Canadian directed fisheries for porbeagle have also been closed since 2013. The other main porbeagle directed fishery in the North Atlantic (EU) ceased operations in 2010.

The General Fisheries Commission for the Mediterranean (GFCM) adopted ICCAT's thresher shark Recommendation (banning retention of bigeye threshers *Alopias superciliosus*) in 2010. In 2012, the GFCM adopted Recommendation GFCM/36/2012/3 prohibiting retention, transhipment, landing, display and sale of the 24 elasmobranch species listed under Annex II of the Barcelona Convention *Protocol Concerning Specially Protected Areas and Biological Diversity in the Mediterranean* including shortfin mako, porbeagle, smooth hammerhead (*Sphyrna zygaena*), scalloped hammerhead (*Sphyrna lewini*), and great hammerhead (*Sphyrna mokarran*). The European Union implemented this measure for relevant EU Member States in 2015.

Porbeagle, hammerheads, oceanic whitetip sharks *(Carcharhinus longimanus)*, and manta rays *(Mobula birostris, M. alfredi)* were listed under Appendix II of the Convention on International Trade in Endangered Species (CITES) in 2013. Threshers *(Alopias spp.)*, silky sharks *(Carcharhinus falciformis)* and the remaining mobulids were added in 2016 (effective October 2017). CITES Appendix II carries a requirement that Parties issue export permits based on findings that take is legal and sustainable. Development of these "non-detriment findings" and related permitting processes is underway.

Parties to the Convention on Migratory Species (CMS) have listed 29 elasmobranch species under its Appendices. Appendix II, which signals a commitment to international cooperation toward conservation, includes makos, porbeagles, hammerheads, threshers, and silky sharks. Mobulid rays are listed on Appendix I, which mandates strict protection. CMS has developed a Memorandum of Understanding specific to sharks as well as a Conservation Action Plan which may aid in implementation CMS listings for elasmobranchs.

### SHK-6. Management recommendations

Precautionary management measures should be considered particularly for stocks where there is the greatest biological vulnerability and conservation concern, and for which there are very few data and/or great uncertainty in assessment results. Management measures should ideally be species-specific whenever possible.

Considering the need to improve stock assessments of pelagic shark species impacted by ICCAT fisheries and bearing in mind Rec. 12-05 adopted in 2012 as well as the various previous recommendations which made the submission of shark data mandatory, the Committee strongly urges the CPCs to provide the corresponding statistics, including discards (dead and alive), of all ICCAT fisheries, including recreational and artisanal fisheries, and to the extent possible non-ICCAT fisheries capturing these species. The Committee considers that a basic premise for correctly evaluating the status of any stock is to have a solid basis to estimate total removals.

The Committee reiterates that the CPCs provide estimates of shark catches in both ICCAT and non-ICCAT fisheries for species that are oceanic, pelagic, and highly migratory within the ICCAT Convention area. The magnitude of shark entanglements in FADs should be investigated. Methods for mitigating shark by-catch in fisheries also need to be investigated and applied.

### SHK-6.1 Blue shark

Considering the uncertainty in stock status results for the South Atlantic stock of blue sharks, the Committee strongly recommends that the Commission considers a precautionary approach for this stock. If the Commission chose to use the same approach taken for the North Atlantic stock, the average catch of the final five years used in the assessment model (28,923 t for 2009-2013) could be used as a limit. For the North Atlantic stock, while all model formulations explored predicted that the stock was not overfished and that overfishing was not occurring, the level of uncertainty in the data inputs and model structural assumptions was high enough to prevent the Committee from reaching a consensus on a specific management recommendation.

#### SHK-6.2 Shortfin mako

For the North Atlantic stock of shortfin mako, the probabilities in the Kobe matrices indicate that to stop overfishing and start rebuilding, the constant annual catch should be reduced to 500 t or less. This will achieve the goal of stopping overfishing in 2018 with a 75% probability, but it only has a 35% probability of rebuilding the stock by 2040. Only a 0t annual catch will rebuild the stock by 2040 with a 54% probability.

The Kobe II strategy matrix (**SHK-Table 3**) shows the range of possible options for the Commission to consider. If the Commission wishes to stop overfishing immediately and achieve rebuilding by 2040 with over a 50% probability, the most effective immediate measure is a complete prohibition of retention. Additional recommended measures that can potentially further reduce incidental mortality include time/area closures, gear restrictions, and safe handling and best practices for the release of live specimens (since post release survival can reach 70%).

The Committee emphasizes that there will be a need for CPCs to strengthen their monitoring and data collection efforts to monitor the future status of this stock, including but not limited to total estimated dead discards and the estimation of CPUE using observer data.

For the South Atlantic stock of shortfin makos, given the uncertainty in stock status, the large fluctuations in catch, the high intrinsic vulnerability of this species, and the depleted status for the North Atlantic stock, the Committee recommends that until this uncertainty is reduced, catch levels should not exceed the minimum catch in the last five years of the assessment (2011-2015; 2,001 t with catch scenario C1).

### SHK-6.3 Porbeagle

The Committee recommends that the Commission work with countries catching porbeagle and relevant RFMOs to ensure recovery of North Atlantic porbeagle stocks (e.g. ICES, NAFO) and cooperate with the current Areas Beyond National Jurisdiction (ABNJ) coordinated South Atlantic stock assessment. In particular, porbeagle fishing mortality should be kept to levels in line with scientific advice and with catches not exceeding the current level. New targeted porbeagle fisheries should be prevented, porbeagles retrieved alive should be released following best handling practices to increase survivorship, and all catches should be reported. Management measures and data collection should be harmonized as much as possible among all relevant RFMOs dealing with these stocks, ICCAT should facilitate appropriate communication.

### NORTH ATLANTIC BLUE SHARK SUMMARY

Provisional Yield (2016) Yield (2013)		42,117 t <sup>1</sup> 36,748 t <sup>2</sup>

**SHK-Figure 8**. Phase plots summarizing scenario outputs for the current (for 2013) stock status of South Atlantic blue shark (BSH). BSP=Bayesian surplus production model; SS-BSP=State-space Bayesian surplus production model. The circle denotes common status for several BSP runs.

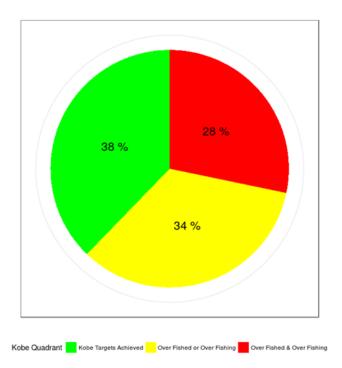

**SHK-Figure 9.** Stock status (2015) of North Atlantic shortfin makos based on Bayesian production models (4 BSP2JAGS and 4 JABBA runs) and 1 length-based, age-structured model (SS3). The clouds of points are the bootstrap estimates for all model runs showing uncertainty around the median point estimate for each of nine model formulations (BSP2JAGS: solid pink circles; JABBA: solid cyan circles; SS3: solid green circle). The marginal density plots shown are the frequency distributions of the bootstrap estimates for each model with respect to relative biomass (top) and relative fishing mortality (right). The red lines are the benchmark levels (ratios equal to 1).

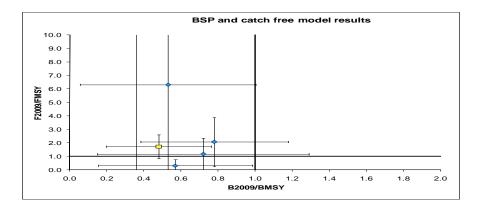

**SHK-Figure 10.** Kobe pie chart summarizing stock status (for 2015) for North Atlantic shortfin makos based on Bayesian production models (4 BSP2JAGS and 4 JABBA runs) and 1 length-based age-structured model (SS3). Probability of being in the green quadrant is less than 0.5%.

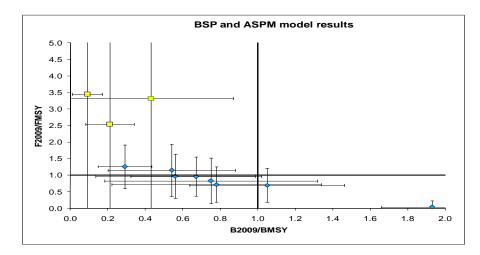

**SHK-Figure 11.** Stock status (2015) of South Atlantic shortfin makos based on a Bayesian production model (BSP2JAGS) and a catch-only model (CMSY). The clouds of points are the bootstrap estimates for all models combined showing uncertainty around the median point estimate for each of four model formulations (BSP2JAGS: solid pink circles; CMSY: solid cyan circles). The marginal density plots shown are the frequency distributions of the bootstrap estimates for each model with respect to relative biomass (top) and relative fishing mortality (right). The red lines are the benchmark levels (ratios equal to 1).

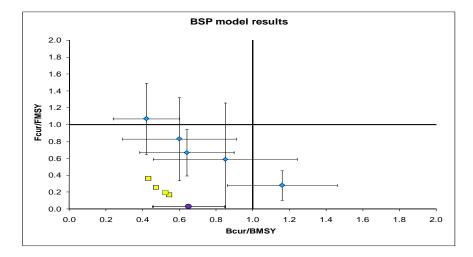

**SHK-Figure 12.** Kobe pie chart summarizing stock status (for 2015) for South Atlantic shortfin makos based on a Bayesian production model (2 BSP2JAGS runs) and a catch-only model (2 CMSY runs).

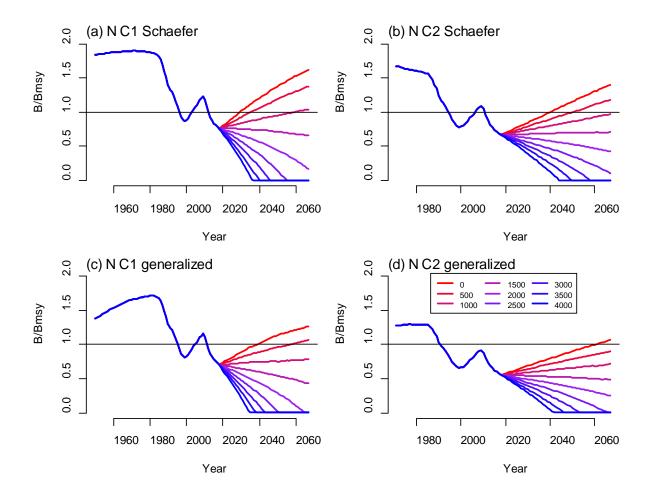

**SHK-Figure 13.** Phase plot for the southwest Atlantic porbeagle, showing status in 2009 from both the BSP model runs (diamonds) and the catch free age structured production model (square) results. Error bars are plus and minus one standard deviation.

**SHK-Figure 14.** Phase plot showing current status of northeast Atlantic porbeagle for the BSP model (diamonds) and the ASPM model (squares). Error bars are plus and minus one standard deviation.

**SHK-Figure 15.** Phase plot showing the northwest Atlantic porbeagle expected value of  $B/B_{MSY}$  and  $F/F_{MSY}$  in the current year, which is either 2005 (diamonds) or 2009 (circle), as well as approximate values from Campana *et al.* (2010) (squares).  $B/B_{MSY}$  was approximated from Campana *et al.* (2010) as N2009/N1961 times 2. Error bars are plus and minus one standard deviation.

**SHK-Figure 16.** Median constant catch projections (0 – 4000 t) from BSP2-JAGS for the North Atlantic shortfin mako. for 4 model runs: (a) C1 catch with a Schaefer model, (b) C2 catch with a Schaefer model, (c) C1 catch with a generalized production model, and (d) C2 catch with a generalized production model.

# 9. Report of intersessional SCRS meetings

The reports of the intersessional meetings held in 2017 were presented.

## 9.1 Meeting of the ICCAT Working Group on Stock Assessment Methods

The WGSAM met in Madrid (8-12 May) and the agenda covered a range of topics including intersessional progress made on CPUE standardization (primarily the inclusion of environmental covariates and the revision of the CPUE Table for Species Groups), Management Strategy Evaluation (MSE), and in implementing the Strategic Plan. Other matters included standardising the format of Executive Summaries, the Peer review of stock assessments and the ICCAT Software Catalogue.

An important development was the formation of Study Groups to promote Intersessional work. Study Groups will be identified by WGSAM members and to help address the objectives of the WGSAM as they pertain to the ICCAT Strategic 5 Year Plan. Two Study Groups were formed namely the Northern Albacore and MSE Study Group and the CPUE Standardization Study Group. Outcomes from this Group were essential if the SRCS is to make progress on the Strategic Plan including streamlining of the current CPUE table in order to reduce unnecessary discussions at future data preparatory meetings and there was agreement that the Northern Albacore and MSE Study Group explore alternative candidate output graphics and summaries based on the Northern Albacore and MSE Study Group results, including those used by other RFMOs.

The Detailed Report of the meeting is presented as document SCRS/2017/005.

The Working Group on Stock Assessment methods Work Plan for 2018 is attached as **Appendix 12**.

# Discussion

This year WGSAM has established study groups and so far two groups have been established the Northern Albacore MSE and the CPUE Standardization study group. Both these study groups directly address two current objectives of the WGSAM under the ICCAT Strategic 5 Year Plan. The main discussion focused on how these groups will operate, their terms of reference and the potential need for other study groups to be formed (e.g. on communication of uncertainty when providing advice). It was explained that these study groups will mainly work inter-sessionally reporting back to WGSAM and have no formal status under the SCRS. It was suggested that the Northern Albacore MSE study group could be expanded to help progress the MSE work planned for other stocks. There was also discussion about whether Chairs (or a designee) of the SCRS Species Groups should attend WGSAM to help pose problem and facilitate the problem solving process, or alternatively the Species Group Chairs could meet to discuss these recommendations during the Species Group meetings.

### 9.2 Small tunas Species Group intersessional meeting

The meeting was held at the University of Miami (24-28 April). The issues of substance dealt with were updating the Ecological Risk Assessment (ERA), reviewing of appropriate approaches for future assessment of small tuna stocks, the status of SMTYP programme to improve collaboration among scientists and how the Atlantic Tropical tuna Tagging Program (AOTTP) could improve knowledge on small tuna populations.

The ERA conducted in 2016 was updated to include gear interactions of small tuna caught in the tuna longline and purse seine fisheries of the Atlantic Ocean. Wahoo and little tunny were the most vulnerable species, confirming previous conclusions of the Group about what stocks should be given high priority. The updated analysis using purse seine provides similar results to the longline results.

A variety of data limited approaches are available and it was agreed that best way to do this is to conduct Management Strategy Evaluation (MSE) to determine the best combination of data, assessment and control measures. MSE can also be used to determine the benefits of improving data collection and the value of new information, including that from the AOTTP. To do this the data rich North Atlantic albacore Operating Model (OM) is being used to simulate data poor time series and the results compared with data rich methods. The Group reiterated that SMTYP should be a collaborative process, increasingly involving more scientists from all nations with major small tuna fisheries.

The Detailed Report of the meeting is presented as document SCRS/2017/004.

The Small Tunas Species Group Work Plan for 2018 is attached as **Appendix 12**.

# 9.3 Tropical Tuna Species Group intersessional meeting

The meeting was held in Madrid, Spain, 4-8 September 2017. In 2017, the Tropical Tuna Species Group identified a number of research lines in order to improve future stock monitoring and management advice. Likewise, substantial progress must be made on the development of the catch statistics and the MSE framework. In 2017, the Tropical Tuna Species Group plans to review all the activities conducted within the Atlantic Ocean Tropical tuna Tagging Programme (AOTTP), the information collected and the plans for future tagging and capacity building initiatives. In addition, in 2017, the Tropical Tuna Species Group discussed and draft a number of responses to the Commission related to Rec. 16-01 and the 2016 FAD Working Group recommendations. Finally the Group developed a work plan and actions in preparation for the MSE of tropical tuna species taking into consideration the assessment schedule of these species in coming years.

The Detailed Report is presented as document SCRS/2017/011 (English version only).

The Tropical Tuna Species Group Work Plan for 2018 is attached as **Appendix 12**.

### Discussion

During 2016 no assessments of tropical tunas were carried out. The Group noted that they had only one intersessional meeting with a full agenda related mainly to FADs and the Moratorium evaluation. A preliminary work plan for the implementation of the MSE for tropical tuna species was also discussed, taking into account the need for updating all assessments prior to MSE development. It was noted that for 2018 the assessment of bigeye tuna is scheduled, as well as several other tasks, this will require a prioritization of task, increasing the intersessional work and coordination, and possible outsourcing specific analysis. The Committee also noted that some of the Commission requests require several years of data collection before a comprehensive analysis can be presented, for example moratorium effects. Following the presentation of the AOTTP project and the recommendations from the Group, a clarification on how the AOTTP will address these recommendations was requested. Additional information as regards the AOTTP is included in section 10.5 of this report.

The Committee was informed that during 2016 the catches of bigeye and yellowfin tuna had exceeded the corresponding TACs adopted by the Commission. In the case of bigeye catches overpassed about 11% of the TAC, while yellowfin tuna catches exceeded by 16% of the TAC. It was noted by the Committee that compared to the projections done at the latest assessments (in 2015 bigeye and in 2016 yellowfin tuna) these over-catches will change the expected probabilities of recovery of the stocks, likely making the previously estimated probabilities optimistic. However, it was noted that no updated projections were done in 2016. It was informed that new indices of abundance for bigeye and yellowfin tuna were presented from South African fisheries that would be considered in future evaluations. The Committee was informed that in the latest years (2014-2016) catches from a major fishery for tropical tunas (Brazil) in the western Atlantic have not been provided. The latter limits substantially the capacity of the Committee to make proper evaluation of current status, in particular for the western skipjack stock.

# 9.4 Albacore Species Group intersessional meeting (including stock assessment of Mediterranean albacore)

The Group met in Madrid, 5-12 June, in order to perform an assessment of Mediterranean Albacore and review the work done on the North Atlantic Albacore MSE.

A reliable assessment of Mediterranean albacore stock status is hindered by the inexistence (or low quality) of catch, catch-effort and size statistics over time for some important fleets. Although recent fishing mortality levels appear to be below F<sub>MSY</sub>, and current biomass is approximately at B<sub>MSY</sub> level unfortunately, due to the limited quantitative information available to the SCRS, there is considerable uncertainty about these results. Therefore catches should not be increased and possibly reduced until abundance trends are confirmed. The precise level of catch would depend on the level of risk the Commission would like to assume. If the downward abundance trends are confirmed, catch levels would need to be further reduced. As a prerequisite of successful assessments of the stock, a complete revision of Task I (aggregated catch, by gear/fleet) and Task II (catch-effort, size) data is recommended, specifically before the year 2000. The Committee believes that the total amount of removals is probably incomplete. To overcome this, the Group continues to recommend that CPCs make additional efforts to participate and be made aware of capacity building funds available for participation in and contributing to working group meetings.

An update of the MSE work conducted for northern albacore and presented at the 2017 WGSAM intersessional meeting was given. The Group agreed to present the MSE results also to the SWGSM whilst acknowledging that diagnostic tests are still being run and that the work will only be considered to have been completely reviewed by the SCRS after the plenary meeting.

The Detailed Report is presented as document SCRS/2017/006.

The Albacore Tuna Species Group Work Plan for 2018 is attached as **Appendix 12**.

### Discussion

### Mediterranean

The Mediterranean stock was last assessed in 2011 and was re-assessed 2017 using a Bayesian surplus production model. Stock status is highly uncertain with respect to both fishing mortality and biomass and recent catches are close to the estimate of MSY (3,419 t). In the past, catches have been greater than MSY and the Committee recommended not to increase catches until recent CPUE trends are confirmed and if the downward trend continues, reductions in catches will be required.

# North Atlantic

The discussion focused on the evaluation of the Harvest Control Rule, however, as this requires a lot of complex explanations it was agreed to defer the discussion to the section on the response to the Commission (section 20). A main point was that the evaluations were of a HCR and not a management procedure (stock assessment estimator and Harvest Control Rules, HCR). This meant that the results from the simulations differed from the actual assessment. It was explained that the results should be interpreted in a relative rather than absolute manner, i.e. they do not provide advice on what the actual TAC should be but how well candidate HCR meet management objectives.

# 9.5 Shortfin mako shark data preparatory and assessment meetings

The Shortfin mako shark data preparatory meeting was held in Madrid, Spain, 28-31 March. The major meeting objective was to revise all available data (catch, effort, CPUE, size and tagging) aiming for the Atlantic stock assessment session in June. The results of several updated analyses and cooperative efforts led by national scientists to gather and analyse data were presented, including the analysis of size data by sex and region for the main fleets operating in the Atlantic and a detailed review of all available life history information. The Shark Research and Data Collection Programme (SRDCP) was also reviewed and revised in light of several budgetary changes.

The Detailed Report of the data preparatory meeting is presented as document SCRS/2017/002.

The Shortfin mako shark stock assessment meeting was held in Madrid Spain, 12-16 June. The objective of this meeting was to assess the status of the stocks (North and South) of Atlantic shortfin mako shark. The last assessment was conducted in 2012. The populations were assessed using several models, from different types of surplus production models to fully integrated age-structured models. For the first time, projections of stock status were conducted for this species and management advice was provided based on Kobe strategy matrices. The assessment represented a significant step forward in the understanding of shortfin mako populations in the Atlantic Ocean.

The Detailed Report of the stock assessment meeting is presented as document SCRS/2017/007.

The Sharks Work Plan for 2018 is attached as **Appendix 12**.

### Discussion

Concern was expressed that the results from the eight Biomass dynamic models were generally pessimistic and tended to outweigh the less pessimistic results of the single SS3 model resulting in a highly pessimistic Kobe pie chart. It was explained that the models presented were those selected by the Group as Base cases. In addition, extensive diagnostics were run that showed the relative reliability of the models used for management advice. The SS3 was less pessimistic, however, as the fleets are mainly catching immature individuals, the projections for this SS3 would likely be more pessimistic than those for biomass dynamic models despite the current status being slightly more positive for SS3.

In addition, the possibility of a single stock of shortfin mako across the Atlantic was raised, but it was clarified that the available data from tagging shows no evidence of mixing between the North and South. The contradiction between the catch and CPUE in the South is likely to be due to the quality of the data rather than a result of possible mixing. It was also clarified that despite this being a by-catch species, the CPUEs are standardized and should, as much as possible, reflect trends in abundance. It was noted that CPUEs for some key areas were not available (such as for Morocco), but it was discussed that the Group had to conduct the assessment with the available data.

### 9.6 Atlantic swordfish data preparatory and stock assessment meetings

The Atlantic Swordfish Data Preparatory meeting was held in Madrid, Spain (3-7 April). One of the major objectives of the meeting was to revise and improve whenever possible, all the existing fisheries and biological information (catches, catch & effort, CPUE, CATDIS, size samples, catch-at-size, and, conventional tagging) aiming to prepare the swordfish Atlantic stock assessment session in June. The work of Group permitted, among other achievements, to improve the overall catch series fisheries (unclassified gear catches are now residual), correct and recover important size samples of various CPCs, and improve the CPUE indices. A detailed work plan was adopted, scheduling the pending tasks and the intermediate work required by both the Secretariat and the national scientists, aiming to have all the conditions (input files, etc.) ready a few weeks prior to the stock assessment session.

The Detailed Report of the meeting is presented as document SCRS/2017/003.

The Atlantic Swordfish Stock Assessment meeting was held at the ICCAT Secretariat in Madrid (3-7 July) when both the North and South Atlantic stock were assessed. A peer review of the assessment was also undertaken by an external expert.

The South Atlantic stock was assessed using biomass dynamic state space models to allow for process error. The stock was estimated to be below  $B_{MSY}$ .

The northern stock was assessed using both biomass dynamic state space models and SS. Both types of models agreed that overfishing is not occurring and biomass is either higher or very close to  $B_{MSY}$ . The results, however, are not entirely comparable with those obtained in the last assessment due to the incorporation of more data sources and updated information.

In 2016 the Commission agreed on a roadmap for the completion of MSE in support of the adoption of a harvest control rule for North Atlantic swordfish. This work started in 2017 and shall be completed by 2019 for a possible adoption of an HCR by the Commission.

The Detailed Report of the meeting is presented as document SCRS/2017/008.

The Swordfish Species Group Work Plan for 2018 is attached as Appendix 12.

## Discussion

The assessment and results of the evaluation for North and South Atlantic swordfish were presented highlighting the use of several models including stock synthesis and Bayesian productions models that allowed using more detailed and fisheries specific data. Questions were raised in the priors used for the South Atlantic stock, it was noted that most of the priors were non-informative and diagnostics and posterior plots indicated no major problems. The Committee indicated that for the South Atlantic, the assessment is the first evaluation providing stock status and biomass and fishing mortality trends, indicating the overfished status. For the North Atlantic stocks, stock status and projections were estimated as the combination of two models (Stock Synthesis and the Bayesian Production model BSP2).

The Committee noted that recent trends of spatial-temporal catch rates in the North Atlantic are likely associated with oceanographic and climatic changes, suggesting further analysis and evaluations on how these changes can affect stock status and management recommendations in the near future.

# 9.7 Bluefin data preparatory meeting and stock assessment meetings

The Bluefin Data Preparatory meeting was held in Madrid, Spain, 6-11 March. The major meeting objective was to revise all available data (catch, effort, CPUE, size and tagging) and review of all available life history information, in preparation for the Atlantic stock assessment session in July. The results of several updated analyses and cooperative efforts led by national scientists to gather and analyse data were presented, including the analysis of size data for the main fleets operating in the Atlantic and Mediterranean Sea. A comprehensive work plan on pending task between national scientist and the Secretariat was adopted to be complete prior to the assessment meeting.

The Detailed Report of the meeting is presented as document SCRS/2017/001.

The Bluefin Stock Assessment meeting was held at the ICCAT Secretariat in Madrid, 20- 28 July. Both the eastern and western stocks were assessed using a variety of models. In addition to substantial revisions to historical fishery data, new fishery-independent series of relative abundance, and new information on life history, a wide range of estimation models were applied to both stocks, including revised configurations of the virtual population analyses (VPAs), statistical catch-at-length, statistical catch-at-age and other integrated assessment models. Of these, the only models deemed to have progressed enough at the conclusion of the meeting to be considered as the basis of management advice were the VPA applications for the eastern stock and the VPA and Stock Synthesis applications for the western stock.

The Detailed Report of the meeting is presented as document SCRS/2017/010.

The Bluefin Tuna Species Group Work Plan for 2018 is attached as **Appendix 12**.

### Discussion

The Committee recognized the great effort from both scientist and the Secretariat during the year to finish the assessment and produce management recommendations. The important inclusion of new revised fisheries data and statistics, biological information (growth, natural mortality), fishery independent indices of abundance was noted, as well as a wide range of assessment models that take full advantage of newer data and better handling of limitations in previous assessments.

The Committee noted that in the current assessment it was not possible to determine biomass reference points for eastern or western bluefin tuna stocks, mainly due to the uncertainty regarding future recruitments. Therefore, stock status and management recommendations were provided on reference to F0.1 exclusively. Projections and TAC recommendations were provided for the upcoming three years with a recommendation for the next assessment in 2020. The Committee noted that overall, the trends of indices, auxiliary data and assessment results indicated a continuation of the recovery of both stocks, in particular

the eastern and Mediterranean bluefin tuna. Consequently, the Commission should consider switching from a recovery to a management strategy for bluefin tuna.

The Bluefin Tuna Species Group Work Plan for 2018 is attached as **Appendix 12**.

# 10. Report of Special Data Collection Research Programmes

# 10.1 Atlantic-wide Research Programme for Bluefin Tuna (ICCAT GBYP)

The activities of the Atlantic-wide Research Programme on Bluefin Tuna (ICCAT GBYP) officially started in March 2010. The sixth phase of ICCAT GBYP activities was completed in February 2017 and most of the activities were reported to the SCRS and the Commission in 2016. The remaining activities in the last part of the sixth phase included (a) the biological studies, (b) the completion of the first part of the feasibility study for the Close kin genetic tagging and, (c) the advances in modelling and MSE efforts. The seventh phase of ICCAT GBYP started on 21 February 2017 and it will be active until 20 February 2018. This phase includes the following activities: (a) coordination, (b) biological studies, (c) data mining and recovery, (d) aerial survey on bluefin tuna spawning aggregations, (e) tagging and (f) modelling approaches. All data recovered in the first phases, covering the period from 1512 to 2009, were made available and presented to the SCRS in 2013, 2015, 2016 and 2017. These data have finally been fully validated and incorporated in the ICCAT bluefin database and used for the bluefin tuna stock assessment. Additional data recovered in phase 6 and in phase 7 were presented to the SCRS in 2017. Most of the electronic tag data from other entities have been recovered in 2016 and in 2017 and made available to the SCRS; the data have been used both for the bluefin tuna stock assessment and for the MSE-OM. ICCAT GBYP in phase 7 also organized additional activities on data recovery, particularly on bluefin tuna longline; the data were presented to the SCRS Sub-committee on Statistics. Tag reporting has further improved, though the recovery rate is still low even if, for the first time, it is over 2.25%. The results of the miniPATs tagging activities conducted since 2011 have further enhanced the knowledge on bluefin tuna behaviour and questioned several previous hypotheses. Technical problems with the last series of electronic tags have been noticed in 2016 and several e-tags were complimentary provided by Wildlife Computer for the activities in phase 7, which were carried out in the EU-Portugal traps and will be carried out in the North Sea (Sweden and Denmark). The large participation of scientific institutions from many countries to the biological studies is further contributing to improve the knowledge on the species biology, but additional effort is needed for having all the analyses pursued. A particular effort for enhancing the ageing of bluefin tuna is devoted in phase 7. The Steering Committee decided to continue the collection of a large amount of samples, both adults and juveniles for the main spawning areas in the Mediterranean, to be used for better assessing both the costs and the difficulties related to a possible CKMR activity that would be potentially useful for providing an estimate of East bluefin tuna SSB. These samples will also improve the number of aging analyses. A contract was issued in 2017 for studying the biological data from the additional spawning area rediscovered in the North West Atlantic (Slope Sea) and the results should be available at the end of phase 7. The fifth aerial survey on bluefin tuna spawning aggregations was successfully carried out in 2017 and the results were made available in real time to the bluefin tuna stock assessment session and were used for the first time in the MSE-OM. The ICCAT GBYP Core Modelling MSE Group held three meetings in 2017. The modelling efforts are continuing in phase 7 and all efforts are directed to further development of a MSE and OM.

The report was adopted and is attached as **Appendix 4**.

### Discussion

The Committee thanked the outgoing Coordinator for his dedication to the programme and congratulated him on the exemplary work he has carried out. The Committee further recognized the important information the Programme has provided to the SCRS. It was acknowledged that it was time for the Programme to take stock on what information is currently available and what the priorities are for the future. Many efforts have been made to collect and compile data, but it was recognized that it may be a good time to focus on what information is currently available, and the analysis of the existing data. The Modelling component of the programme was highlighted as an important priority moving forward. It was agreed that the Management Strategy Evaluation Process has been initiated, but it is time to increase the participation in this component and make it more inclusive. The importance of widely disseminating the results of the

MSE process was also stressed as well as identifying the appropriate forum to do so as significant time is required to adequately assess this complicated initiative.

It was also noted that the tagging of highly migratory species remains a concern, as does the collection of biological samples from these species. Although several tagging and data collection initiatives exist, there is a need to harmonize efforts in order to ensure the proper stratification and representation of the collected samples. These data are crucial for the success of the complicated models the SCRS is increasingly using for stock assessment. It was also suggested that the Programme should consider the Ecosystem role of bluefin tuna and collect data to facilitate analysis of this role.

# 10.2 Enhanced Programme for Billfish Research (EPBR)

The ICCAT Enhanced Programme for Billfish Research (EPBR) continued its activities in 2016. The Secretariat coordinates the transfer of funds information, and data. The overall programme Coordinator during 2015 was Dr. John P. Hoolihan (USA), whom also assumed the coordination for the western Atlantic Ocean, and Dr. Fambaye Ngom Sow (Senegal) coordinated activities for the eastern Atlantic Ocean. The original plan (1986) for EPBR included the following objectives: (1) to provide more detailed catch and effort statistics, particularly for size frequency data; (2) to initiate the ICCAT tagging program for billfish; and (3) to assist in collecting data for age and growth studies. These objectives have been expanded to evaluate adult billfish habitat use, study billfish spawning patterns and billfish population genetics, as these are essential aspects to improve billfish assessments. The programme depends on financial contributions, including in-kind support, to reach its objectives. This support is especially critical because the largest portion of billfish catches in recent years comes from countries that depend on the support of the programme to collect fishery data and biological samples. ICCAT has provided financial support in recent years, while annual contributions have been made from Chinese Taipei since 2009. EPBR continued funding support for billfish landing studies carried out by western African CPCs. This resulted in scientists from Côte d'Ivoire, Ghana, São Tomé and Príncipe and Senegal, participating in an ICCAT workshop to develop indices of abundance for sailfish. Subsequently, their data and results were presented and used in the recent sailfish stock assessment session. The billfish age and growth biological sampling programme initiated in 2016 for West African CPCs was hampered by the fact that fishermen did not allow sampling unless fish were purchased. The programme is looking at ways on how to facilitate such purchases with the help of the ICCAT Secretariat. The genetic sampling study to compare mixing and distribution of white marlin and roundscale spearfish is ongoing. No samples have been returned for 2017, as of 15 September.

The report was adopted and is attached as **Appendix 5**.

### Discussion

The Committee acknowledged the importance of the work being conducted under the programme due to the lack of information available on billfish species. It was clarified that the programme is reliant on contributions from CPCs to conduct the activities identified as important. Chinese Taipei confirmed their commitment to continue their support for the Programme financially. The Committee also noted that there is a lack of data regarding billfish catches on anchored FADs and a data recovery initiative could be included in future programme activities.

# 10.3 Small Tunas Research Programme (SMTYP)

In 2017, SMTYP continued the recovery of historical Task I and Task II data series and launched a call for the collection of biological samples for the main small tuna species for the second consecutive year. This will reinforce data mining of Task I and Task II and enhance biological knowledge on those species, aiming at future small tuna stock assessments. In that regards, three contracts were issued by the ICCAT Secretariat during 2017 to conduct data mining and biological studies in the Mediterranean and in the North-eastern Atlantic, whose preliminary results were presented during the annual meeting of the Small Tunas Species Group.

The Group identified the priorities that should be taken into account both in terms of the species to be sampled and the biological data to be collected under the SMTYP in the following biennium. These priorities are presented in the Small Tunas Work Plan for 2018 (**Appendix 12**).

The report was adopted and is attached as **Appendix 6**.

# Discussion

The Committee acknowledged the progress being made on small tuna data collection by the Programme.

# 10.4 Shark Research and Data Collection Programme (SRDCP)

The SRDCP completed the collaborative work related to updating the age and growth dynamics of the shortfin mako in the Atlantic Ocean and the results of the study were used in the 2017 Shortfin Mako stock assessment. The population genetics study to estimate stock structure and phylogeography included additional samples from areas with previously little coverage and confirmed earlier findings. A post-release mortality study of shortfin mako caught on pelagic longline fisheries continued with the deployment of new Survivorship Popup Satellite Archival Transmitting Tags (sPATs). A total of 21 tags have been deployed to date for this project in the northwest, northeast, tropical northeast and equatorial region, and southwest Atlantic. A total of 23 data sets from electronic tagging (14 sPATS and 9 miniPATs) are already available as part of the satellite telemetry study to gather and provide information on stock boundaries, movement patterns and habitat use by the shortfin mako shark and an additional 13 tags are awaiting deployment. Additionally, two projects on porbeagle were started: a life history (reproduction) study aimed at improving the knowledge of its reproductive cycle and a study aimed at better understanding the movement patterns, stock boundary, and habitat use of this species in the Atlantic.

The report was adopted and is attached as Appendix 7.

### Discussion

The Committee expressed its strong support for this Programme. It was noted that the Commission is increasingly requesting advice on shark species and this Programme has provided crucial data that has been used to assess shark species. The Programme was also acknowledged as initiating beneficial collaborations between a wide variety of CPCs which have facilitated several cooperative studies and facilitated data sharing.

# 10.5 Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP)

AOTTP has continued to make progress towards its targets since the 2016 SCRS Plenary. More than 500 days at sea have been spent on more than 50 tagging cruises throughout the Atlantic. Nearly 60,000 fish (ca 50% of the target) have been tagged with conventional tags in the EEZs of fifteen different countries, for which permission was sought and granted, in addition to the High Seas. More than 8,000 fish have been double-tagged allowing tag-shedding rates to be estimated, while 4,000 have been marked chemically to improve subsequent ageing of recovered fish. More than 300 electronic tags (pop-ups and internals) have been deployed, providing information on tuna migrations and habitat preferences. Scientists and technicians, including 3 women, from developing countries have tagged over half of these fish. Tag-recovery and awareness raising infrastructures have been set up in ten countries, and more than 10,000 tags have been recovered (ca 20% recovery rate) for which rewards have been paid. Tag-seeding experiments are under way. A lottery to promote the project among stakeholders was organised in September 2016 by ICCAT, and a large cash prize paid. Posters, t-shirts, and caps have been designed in four languages. An expert group to improve age-determination and build capacity was organised by our partners in Abidjan in March 2017. Relational databases and smartphone applications for populating them have been designed, developed and implemented. More than 60 researchers and technicians from developing countries have been trained in all aspects of tagging at sea, tag-recovery, and data transmission methodologies. AOTTP coordination is continuing to work with the SCRS to build scientific capacity among ICCAT CPCs and make effective use of the tagging data for improving the tropical tuna stock assessments. In spite of the late start the AOTTP is on course to meet its objectives.

The report was adopted and is attached as **Appendix 8**.

#### Discussion

The Committee noted the extensive work already conducted by the project. There was a strong feeling that the project team should increase collaboration and information sharing with additional experts, particularly those involved in electronic tagging to ensure that the protocols are evaluated and the best possible practice used. This is especially important in light of the disappointing results for electronic tagging thus far. It was noted that several species groups have electronic tagging components to their research programme.

It was also noted that the Tropical Tuna Working Group had expressed the need to increase the number of tag seeding experiments and the number of total tags used in the seeding. The project Coordinator confirmed that this was an important consideration, and plans were already in place to facilitate this request.

The Committee acknowledged that this is an extremely important research project that has a very ambitious scope with the potential to provide a large amount of crucial data to the SCRS. The necessity to maximize the outputs from this project was noted particularly in light of the importance of these tropical tuna species to the Commission. The Secretariat thanked all the contributors to the funding of the project, and in particular the EU. It was also noted that an additional contribution of \$US15,000 had recently been received from the USA.

#### 11. Report of the Sub-committee on Statistics

Dr. Guillermo Diaz, Convener of the Sub-committee on Statistics, presented the Sub-committee's report (Madrid, 25 and 26 September 2017) to the SCRS, and acknowledged the enormous work of the Secretariat and all its support to this Sub-committee and the SCRS in general. Dr. Diaz referenced the Secretariat report on Statistics (SCI-008) which has detailed explanations of important matters such as, the current CPCs reporting status (using the SCRS filtering criteria to validate 2016 Task I Task II data), the improvements made in statistics (historical revisions and recoveries) and related data handling tools (databases, infrastructure, technologies, etc.), and the progress made in various Secretariat ongoing projects (historical data recoveries, online reporting prototyping, preliminary work on scoring data availability, etc.). The preliminary work of the Secretariat on the ICCAT "scoreboard" on data availability was also welcomed by the Sub-committee which accepted it and supported its future development.

A special emphasis was made regarding the failure of most CPCs to report both dead and alive discards in Task I (mandatory, but highly incomplete in all species), as required by the Commission, and the imperative need to improve this aspect in the short term. The Convener also recalled that, as in last few years, Task I updates which arrive late during the SCRS Species Groups meetings will only be made after the SCRS meeting. In the same subject, but associated with exceptional cases of virtually full Task I corrections made by a CPC to preliminary catches (last four most recent years as defined by the SCRS), the Convener (referring the properly made Japanese Task I corrections to 2014 and 2015 catches of the majority of the species) recommended that the related Species Groups be properly informed (by the CPCs and the Secretariat) of those corrections, in particular when the changes are substantial.

The Convener also summarised the accomplishment status of the 2016 Sub-committee recommendations, reiterating the need to continue advancing on the ones that have not been completed, as is the case of the need of an active participation of the Species Group rapporteurs and CPC statistical correspondents. It was recalled that many decisions made by this Sub-committee usually affect the entire ICCAT community, such as, the set of proposals aiming to improve and normalise the ICCAT coding system, as well as important changes made to Task I and Task II forms (currently all Task II must be reported by month, and allow submissions with multiple years).

The progress made on the ICCAT online reporting system (three complementary developments in place, described in SCI-008) deserved also a special mention. The Convener informed that, they share common goals and should converge in the future, if possible under the guidance of the Commission Working Group for the online reporting system implementation. It was also agreed that the SCRS statistical online validation system made by the Secretariat is now sufficiently advanced to start a testing phase during 2018 (details in the report). The Sub-committee considers that the Commission should continue to support this work on online reporting.

The Convener also presented the revised (and adopted) data dissemination rules, which also take into account particular data sharing situations which can be evaluated case by case, and the access to historical meetings data.

Finally, the Sub-committee presented to the SCRS its 2017/2018 work plan (Appendix 12).

The Report was adopted and is attached as Appendix 9.

#### Discussion

The SCRS Chair started by appreciating the increasing level of participation to the Sub-committee in the recent years, and also reiterated the invitation of this Sub-committee for an active participation of the Species Groups Chairs and CPC scientists. The Committee concurred with the appreciation and recommendation of both the SCRS Chair and the Sub-committee on Statistics Chairs, noting that, decisions made during Sub-committee meetings could affect the entire ICCAT community.

Japan informed the SCRS that the Task I corrections for 2014 and 2015 catches (except bluefin tuna) was caused by a software error. These corrections were however, duly informed (reflecting the catches presented in the Annual Report) and did not affect any of the scientific work of made during 2017. The Committee, thanked the Sub-committee Convener for handling a great amount of complex matters in such an effective way, asked if this error only affects Task I or both Task I and Task II datasets. Japan informed that it only affects Task I.

# 12. Report of the Sub-committee on Ecosystems and By-catch

An Intersessional Meeting of the Sub-committee on Ecosystems and By-catch was held in Madrid, Spain 10-14 July 2017. The progress made towards implementing ecosystems based fisheries management (EBFM) jointly among the five t-RFMOs was presented. The Sub-committee furthered its progress on an EBFM plan by developing the framework for an ecosystem report card that is to be populated intersessionally and presented at the 2018 Sub-committee on Ecosystems meeting and to the Commission. Lastly, the Subcommittee reviewed the available information on the trophic ecology of unique pelagic ecosystems that are important for ICCAT species in the Convention area. During the by-catch section, a proposed revision to the observer data collection forms was discussed. As well, the assessment of the impact of ICCAT fisheries on sea turtles was updated and advances on collaborative work amongst CPC scientists to assess seabird bycatch in the pelagic longline fleets was reviewed. The Sub-committee also noted that several teleost fish species with large landings, which are not by-catch and are not considered by other species groups, require further attention.

The Detailed Report of the meeting of the Sub-committee on Ecosystems and By-catch is presented as document SCRS/2017/009.

The Report of the intersessional meeting is attached as **Appendix 10**.

#### Discussion

The Committee supported the proposed intersessional work of the Sub-Committee to develop a draft ecosystem report card to inform the Commission of the current status of components of the ecosystem affected by its management.

A clarification on the recommendation by the Sub-committee on sea turtle mitigation was requested. It was queried as to whether this recommendation should be formulated into a response to the Commission, or whether it would be retained as a recommendation in the text of the SCRS Report. It was clarified that significant progress had been made and consensus text had been drafted on a recommendation. It was the feeling of both the co-convener of the Sub-committee and the Chair of the SCRS that at this stage the recommendation be retained in the SCRS Report. The Committee supported the collaborations being conducted between CPC scientists to evaluate the impact of fishing on seabirds.

### 13. Considerations of implications of the Meeting of the Joint t-RFMO FAD Working Group

As part of the Kobe process, ICCAT hosted the first meeting of the Joint t-RFMO FAD Working Group in Madrid in April 2017. The meeting allowed scientists, managers and other stakeholders from ICCAT, IATTC and IOTC to discuss issues related to FAD management and research and enhance cooperation between the three t-RFMOs. The meeting identified a list of priority future actions to be taken by the join t-RFMO FAD Working Group and recommended the creation of a technical working group to advance some of these actions. Details of meeting outcomes can be found in the report of the meeting.

The ICCAT Working Group reviewed these conclusions, and results of their discussions are referenced in section 14.

#### Discussion

ICCAT's leading role in the organization of the meeting, which had a high level of participation, was highlighted. Additionally, the importance of the cooperative work developed prior to the meeting was mentioned. The joint t-RFMO FAD Working Group is the proper forum to share experiences between all those involved in FAD fisheries in different Oceans, as demonstrated by achieving results of the meeting, regardless of WPCFC's decision not to participate. The Committee reiterated the importance of keeping the Working Group active in the future and urged the technical Working Group to start working as soon as possible.

### 14. Report of the Third meeting of the Ad hoc Working Group on FADs

Rec. [16-02] of the Commission revised the terms of reference of the FAD Working Group and requested a meeting of the Working Group in 2017. The Working Group met in Madrid, 11-12 September 2017, and 8 CPCs and 3 NGOs were in attendance. The Working Group addressed the following points:

- Review of the information on FADs provided by CPCs;
- Evaluate progress made based on the recommendations issued by the Working Group in 2016;
- Considerations from the First Joint t-RFMO FAD Working Group meeting;
- Assessment of developments in FAD-related technology;
- Describe the effects of FAD use on the fishing mortality of stocks of tropical tuna;
- Consideration of recommendations to the Commission for possible additional actions on management of FADs.

Details of the discussions and documents of this meeting are contained in the report of the meeting, which as per the time of the SCRS 2017 Plenary, the meeting report was not yet available. Therefore the SCRS Species Groups have not had a chance to review the outcomes of this meeting. However, the Sub- Committee of Statistics did consider a few of the recommendations made by the ICCAT FAD Working Group during its September meeting and details of these considerations are included in the report of the Sub-Committee (item 11 of this report).

In 2016 the Commission requested the SCRS to provide feedback on the recommendations made by the FAD working group in 2016, such response is contained in section 20.4 of this report.

#### Discussion

The SCRS Chair reported on the topics discussed, mainly following the recommendations and task highlighted from the First joint t-RFMOs FAD Working Group meeting identified for ICCAT (see Section 13 and [SCI-046]). Within these tasks are the development of a work plan to address research, data collection and analysis of FAD fisheries information, review and adoption of FAD related technical and legal definitions. To facilitate and accelerate the progress toward meeting SCRS and Commission objectives concerning the recommendations of the joint t-RFMO FAD meeting and the ICCAT FAD Working Group, the Coordinator of the Tropical Species suggested forming a "study group" to review and prioritize the recommendations, and prepare a work plan which would be presented to the Tropical Tuna Species Group and the SCRS in 2018. The study group would be open to interested stakeholders. It was also noted the importance of integrating not only the Tropical Tunas Species Group, but also the rapporteur of the Sharks

Species Group, and the Conveners of the Sub-Committee on Ecosystems as important research and a new information have been presented from non-target species that interact with FAD fisheries. The study group would meet intersessionally via remote communications (e.g. webinars, video conferencing).

# **15.** Considerations of implications of the Meeting of the Standing Working Group on Dialogue between Fisheries Scientists and Managers (SWGSM)

The meeting was held in Madrid Spain, 29-30 June. The objectives of this meeting were to analyse of how management objectives have been established for priority stocks (tropical tunas, N-ALB, N-SWO and BFT); to inform on which performance indicators have been identified; and to report on the progress toward MSE/HCR development to date. The Secretariat provided an overview of the outcomes of the 2016 Joint Tuna RFMOs Working Group on Management Strategy Evaluation (MSE). Additionally, the Secretariat provided a summary of the work developed during the Joint Meeting of tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management, initiated by ICCAT and supported by the Common Oceans/ABNJ Tuna Project, which brought together scientists from the five t-RFMOs and national experts. The goals of the latter meeting were to (1) establish a sustained dialogue across t-RFMOs on the issues of EAF and its implementation, (2) understand common challenges in its implementation and (3) identify case specific solutions. A number of recommendations to the Commission were made as regards different issues covered during the meeting.

The Report of the meeting is presented as document SCI\_045.

#### 16. Progress related to work developed on MSE

#### 16.1 Work developed by the t-RFMO MSE Working Group

The Joint Management Strategy Evaluation (MSE) Technical Working Group (TWG) was created during the Third Joint Meeting of Tuna RFMOs (the "Kobe process") in 2011 to support the implementation of the Precautionary Approach for tuna fisheries management. The TWG has previously reviewed the Kobe Advice Framework and how the adoption of MSE would change the way that risk and uncertainty is communicated. The Working Group had its first official meeting in Madrid from 1-3 November 2016. The objectives of the meeting were to: i) review current MSE practice, successes, failures and potential areas for collaboration; ii) discuss progress on MSE; and iii) identify future actions focusing on areas for collaboration.

The workshop was organised around five themes, namely:

- 1. The MSE process and stakeholder dialogue;
- 2. Conditioning operating models;
- 3. Albacore case study currently underway across t-RFMOs;
- 4. Computational aspects;
- 5. Dissemination of results.

The TWG has not conducted a comprehensive review of the approaches and processes used when developing MPs across but agreed these should be developed. However, an initiative is needed to identify additional key issues required to further facilitate adoption of Management Procedures in the t-RFMOs. The Group reviewed the operating models (OMs) currently being developed across the t-RFMOs and found that the range of OMs examined were primarily based on assessment models. In some cases these OMs were developed to contain peculiarities of the stock/species not considered in the current assessment models runs, e.g. including spatial structure, as in the case of Indian Ocean skipjack and Atlantic Ocean bluefin tuna. The current approach using an assessment model as the basis for OM design is a good starting point, though further processes (observation error and ecological processes with time dependence) should be accounted for in OM designs to ensure robustness.

The albacore case study takes advantage of the relative advancement of MSE for several of the albacore stocks across t-RFMOs, and of the relative simplicity of the operating models required. The case study will provide an opportunity to collaborate across RFMOs by conducting comparative studies on worldwide albacore stocks. The study will allow experiences to be shared, and provide a test bed for method

development allowing rigorous, transparent, and replicable testing of methods and software. Expected outcomes are improved collaboration on developing a common dialogue, new models and software, and promoting interdisciplinary work.

The TWG has agreed that software validation is important, and should include tests across platforms, open code, and complete traceability. The user interface <a href="http://www.stockassessment.org">http://www.stockassessment.org</a> and the use of "Makefiles" was highlighted as an example of such an open and transparent framework, which could be used for both stock assessments and development of MSE. The need for communication and visualisation tools, such as standardised "shiny apps", was highlighted. Support for the development of those tools may be available from partner institutions and/or other organizations. The TWG agreed to continue to work intersessionally on methods development and on case studies; in addition the TWG will investigate holding an MSE/CAPAM workshop followed by a special issue in Fisheries Research in 2019.

# 16.2 Work conducted under ICCAT GBYP

The bluefin MSE specifications is being developed by the bluefin tuna Core Modelling Group and is funded by the ICCAT GBYP. Four meetings of the ICCAT GBYP Core Modelling MSE Group were held since the 2016 SCRS plenary meeting. The reports of these meetings are available at: http://www.iccat.int/GBYP/en/modelling.htm

An operating model (OM) framework allowing mixing between the two stocks has been developed and conditioned to data on relative abundance, tagging and stock of origin. A core set of operating models has been agreed to span the major uncertainties identified in bluefin stock assessments.

The Group decided to initially explore management procedures that are based on empirical indicators of stock abundance rather than on model-based indicators of stock abundance as was the case for the northern albacore MSE. The reason for this choice is that experience suggests that such simple formulae are more readily understood and accepted by stakeholders. An initial set of relative abundance indices (three for the west and four for the east) have been selected as possible candidates to be examined as part of the management procedures to be tested for the setting of future TACs. A computer package which will allow the SCRS to easily test management procedures is virtually completed.

The next steps in the bluefin tuna MSE are:

- to encourage different SCRS scientists and managers to suggest management procedures based on the proposed set of relative abundance indices. These interactions could happen through:
  - a special joint meeting of the swordfish working group and bluefin tuna working group which focused exclusively on MSE;
  - $\circ~$  a special meeting of panel two which had a strong focus on MSE;
- to evaluate such management procedures over the course of 2018;
- to request the SCRS to select a small set of management procedures and their evaluations to be reported to the 2018 Commission meeting;
- to request the Commission to provide feedback on the tested management procedures and agree on a final set of management procedures to be evaluated for final presentation at the 2019 Commission meeting.

#### Discussions

An important point of discussion was how to ensure wide collaboration when conducting work on MSE. It was explained that it had been difficult to involve wider participation in the work in 2017 as it was only in this year that the Operating Model (OM) and code were ready and the BFT species group was fully occupied in conducting a full assessment.

It was agreed that in 2018 an intersessional meeting of the BFT species group should be held where teams developing candidate Management Plans (MPs) could work with the Core Modelling Group and members of the bluefin working group. It was pointed out such a meeting was already in the bluefin work plan and the work on developing MPs would be presented in September. It was also agreed that this requires CPCs to commit to developing candidate MPs.

A concern was expressed that the work required to conduct the MSE could create problems when conducting MSEs for other stocks. Hope was expressed that the work being done for bluefin and albacore (supported by the GBYP and the EU) will actually help with other planned MSEs. For example a suggestion was made that scheduling MSE meetings so that overlap may help in allowing different groups to collaborate. It was also agreed that there was a problem with resourcing, both with respect to people and finance.

The need for oversight and to ensure more involvement in the MSE processes was stressed. Although the MSE work for respective species was proceeding independently the WGSAM has a standing term of reference on MSE and the work has been reported to the Meeting of the Standing Working Group on Dialogue between Fisheries Scientists and Managers.

# 16.3 Work conducted for other species

A comprehensive "full MSE" includes a structured consultation process with managers about objectives; the selection of performance indicators and candidate harvest control rules; the development of a broad set of operating model hypotheses on plausible states of the system; an agreed way to reject and weight Operating Model hypotheses; an observation error model which can mimic the data types, and their error structure, to be included in the management procedure; identification of candidate management procedures, and testing of management procedures with the full feedback loop, including implementation uncertainty. The full MSE also requires extensive consultation between scientists, managers and other stakeholders.

#### North Atlantic albacore

Rec. 16-06 states that "in 2017, the SCRS shall refine the testing of candidate reference points and associated harvest control rules (HCRs) that would support the management objective", which is "(a) to maintain the stock in the green quadrant of the Kobe plot with at least a 60% of probability, while maximizing long-term yield from the fishery, and (b) where SSB<SSB<sub>MSY</sub>, to rebuild SSB to or above SSB<sub>MSY</sub>, with at least a 60% probability, and within as short time as possible, while maximizing average catch and minimizing inter-annual fluctuations in TAC levels".

The SCRS continued to work on MSE of albacore and provided reports of its progress to the December 2016 meeting of the tRFMO technical MSE group, the May 2017 meeting of the SCRS WGSAM and the June 2017 meetings of the albacore species group and Standing Working Group to Enhance Dialogue between Fisheries Scientists and Managers (SWGSM). All these groups provided input to the MSE simulations that helped improve the evaluations of management procedures conducted through the Albacore MSE. Details of the results of these evaluations are presented in the above mentioned meeting reports, in the albacore executive summary and in sections 20.16 and 20.17 of this report. The last two sections also contain the possible short term TACs resulting from implementing the harvest control rules tested with the MSE.

# Swordfish

In 2016 the Commission agreed on a roadmap for the completion of MSE in support of the adoption of a harvest control rule for North Atlantic swordfish. During the current meeting, the SCRS Chair summarized the implications of the calendar described in the roadmap. This roadmap calls for the process of development of MSE to start in earnest in 2017 and be completed by 2019 for a possible adoption of an HCR by the Commission.

It was pointed out that work on MSE for swordfish is less advanced than for albacore or bluefin tuna and therefore that it will be challenging to abide by the schedule adopted by the Commission. The Swordfish Species Group recognized that delivering MSE results for North Atlantic swordfish according to the schedule agreed upon by the Commission will be very challenging and require time and resources that are not presently available to the SCRS. It was also agreed that a detailed proposal for the research plan to support the North Atlantic swordfish MSE timetable, including costs, should be developed by the SCRS and presented to the Commission.

Any work on MSE for North Atlantic swordfish will be useful for future MSEs for other Atlantic swordfish stocks.

#### Tropical tunas

The Commission requests related to MSE are contained in [Rec. 16-01]. This includes the review of performance indicators to be used on MSE. The tropical tuna species group discussed how the schedule for the development of MSE, which calls for the MSE results to be first available in 2020, relates to the current schedule of assessments for tropical tunas (2018 for bigeye, 2019 for skipjack and 2021 for yellowfin). The Committee noted that given the multi-species nature of the tropical tuna fishery, the MSE should take this into account. The Committee developed an initial schedule of activities to progress the MSE and the species rapporteurs agreed to develop a budget to be considered by the SCRS and incorporated into a comprehensive MSE budget for the SCRS.

#### Small tunas

A variety of data limited approaches are available and it was agreed that the best way to do this is to conduct Management Strategy Evaluation (MSE) to determine the best combination of data, assessment and control measures. MSE can also be used to determine the benefits of improving data collection and the value of new information, including that from the AOTTP. To do this the data rich North Atlantic albacore Operating Model (OM) is being used to simulate data poor time series and the results compared with data rich methods.

#### **Resourcing MSE process**

The SCRS agreed to provide the Commission a comprehensive proposal that would integrate the needs to conduct MSE for all tuna stocks given that the capacity and resources needed to implement such processes would be more efficiently used if such proposal existed. **Appendix 13** provides a draft of such comprehensive proposal so that the Commission can get an idea of the resources required to implement the MSE process.

The SCRS notes that the FAO ABNJ tuna project is a possible source for supporting parts of the process, particularly those related to capacity building and dialog between stakeholders and that some ICCAT CPCs have already funded components of the process related to the technical aspects of the simulations. It is also worth noting that the resourcing of this process goes beyond the resources currently available to the SCRS.

# 17. Report of the implementation of the Science Strategic Plan for 2015-2020 in 2017 and work plan for 2018, which includes the update of the stock assessment software catalogue

The report summarizes the progress in the implementation of the plan at the midpoint of the five year period, in the middle of 2017.

The Chair of the SCRS requested guidance to the SCRS and the Commission on the format of this review in 2016. The proposal of the SCRS Chair was to summarize progress by providing a simple table which:

- 1. identify the main body of the SCRS responsible for implementing the strategies proposed associated with each of the major objectives contained in the plan;
- 2. provide information on which of the measurable targets included in the plan had been reached;
- 3. categorize progress toward reaching each of the objectives in simple categories.

Progress is reasonable for most of the objectives, and a few have already been met, and some examples are provided below. For instance there has been an increase in the dialogue between scientists and managers, and broadening technical consultations with other RFMOs. During 2016 and 2017 SCRS scientists, commissioners and other stakeholders met, during meetings of the FAD Working Group, the SWGSM and Panel 2, to help advance the work of the SCRS. Those same years SCRS scientists have participated in tRFMO meetings focusing on FADs, MSE and Ecosystems Based Fishery Management. Another objective been met is the increase in the participation of G77 scientists in SCRS meetings facilitated by the funds made available by ICCAT and by the incorporation of more G77 scientists as SCRS officers. Targets for development of a schedule of MSE work and the planning for the implementation of Ecosystem Based Fishery Management have been already met.

There are some objectives, however, for which progress has been slow and a few examples are provided herein. There is an MOU with Aquatic Living Resources to publish selected peer review papers related to ICCAT work, however, few SCRS scientists are taking advantage of this publishing mechanism. Neither the SCRS nor the Secretariat has developed a specific strategy to better disseminate the results of their work to the general public. There are still some SCRS meetings where there are no scientists in attendance from some of the CPCs which catch a very large part of catch of the stock being assessed.

**Table 1** provides detailed information on each of the objectives and identifies progress in meeting the measurable targets.

During 2018, the SCRS Working Groups and Sub-committees will review this progress table and evaluate whether to add or modify the strategies proposed in the plan to ensure full implementation of the plan's objectives.

**Table 1.** Summary of progress in the implementation of the ICCAT Science Strategic Plan.

Targets already reached/exceeded or will be reached soon Good progress with some targets reached but not all Small progress or no progress with no targets reached

DATA	COLLECTION			
Goal	Objective	Measureable targets	Reporting responsibility for targets	Notes on measurable targets
1.1	Strengthen the collection of High Quality Task I and II data and to address data gaps that are identified	A 20% reduction in missing or lacking data items in the Secretariat's annual report on statistics.	Secretariat	Improvements in data continue. See Sec. Report on Stats. and Coord. of Research.
1.2	Improve resolution and precision of total catch composition and distribution and fishing effort data across CPCs	Fishery catch/effort maps at 1x10 resolution, by month by major gear type by 2020, in support of fine scale (time and space) fishery management advice.	Secretariat	Available for some species and fleets
1.3	Improve the fulfilment of the CPC's data reporting obligations	20% reduction in of non-compliance with CPC reporting obligations according to Secretariat's compilation report within 5 years.	Secretariat	Significant progress in some data sets but not others, especially those related to by-catch, and discards
2.1	Identify the types of biological data that is needed (stock structure, growth, maturity, fecundity, etc.)	Application of MSE to the main ICCAT stocks to evaluate biological data needs by 2018 & Conduct Ecological Risk Assessment (ERAs) for those species for which lack of information prevents quantitative assessments of stock status, by 2020.	Sp WG	MSE schedule developed with Commission. ERAs for small tunas initiated

2.2	Elaborate sampling designs and evaluate the representativeness of samples of length (age) needed for each stock	Sampling designs for all the main stocks under Commission responsibility elaborated by SCRS by 2020.	Sp WG	Little progress
2.3	Develop coordinated biological sampling programmes for ICCAT stocks	Increase of 50% in biological sampling programmes within a 5-year time frame.	Sp WG	Significant progress for BFT, SMA, BSH and some SMT. Slow progress on billfish in recent years.
3.1	Develop a comprehensive by-catch & observer data set	Representative observer and by-catch data set from 80% of the ICCAT fleets by 2020 and evidence of increase in analyses of CPC observer data through the number of papers submitted to SCRS annually.	Sub-Com Stat	Large improvement of data provided by some of the major PS fleets. Limited progress for other gears.
3.2	Elucidate data needs for Provision of Ecosystem Based Fishery Management Advice	Developing protocols for the collection of socio- economic data. Application of Integrated ecosystem models	Sub-Com Stat	Socio-economic data provision no progress because of low priority given by Commission. Sub-com. Ecosystem developing Ecosystem report cards.

DIAL	OGUE AND COMMUNICATION			
Goal	Objective	Measureable targets	Reporting responsibility for targets	Notes on measurable targets
1.1	Elevate science-management dialogue in support of defining critical elements of the decision framework policies of Rec. [11-13]: "high probability" and "as short a period as possible"	To provide mechanisms to the Commission so as to be able to adopt probabilities and deadlines for stocks before 2020 (50% percent of cost to be covered by GEF/ABNJ project).	SCRS Chair	MSE work schedule adopted by Commission, Panel 2 meeting in 2016. Resourcing needs Commission commitment. Challenging to increase capacity.
2.1	Institute periodic meetings with decision makers, SCRS scientists, and stakeholder with more opportunity for free interchange (i.e., not in the usual Commission format)	An SCRS-COM stakeholders meeting in the format of the SCRS Working Groups (50% percent of cost to be covered by GEF/ABNJ project).	SCRS Chair	WG Dialogue meeting in 2016, 2017. Panel 2 meeting in 2016. FAD meetings in 2016 and 2017.
3.1	Increase interaction between SCRS officers	100% SCRS officers participate in the SCSTAT meetings. 100% of SCRS officers participate in the annual coordination meeting	SCRS Chair	In 2016, 15 of 18 attended and in 2017, 14 of 18. Proposal to switch timing of Sub-com Stat. Possibly require only at least one rapporteur from each WG.

3.2	Develop better dialog between the working group chair and potential participants	Broader participation in the working group reports. Develop a protocol for the submission of documents prior to meetings. 100% of the work plans established (containing deadlines, allocated responsibilities, framed within the strategic plan, subject to financial and technical conditions).	Secretariat	Occurring in some groups not in all. Requires improvement
4.1	Strengthen linkages and collaboration with other Tuna Regional Fishery Management Organizations (tRFMOs)	Broader participation in the Working Group reports. External experts or scientists from other tRFMOs will participate in five SCRS meetings up to 2020. An inter t-RFMOs meeting on an area of common interest before 2020.	SCRS Chair	TRFMO MSE meeting (Nov 2016) FAD tRFMO meeting May 2017 ICCAT represented in CITES tRFMO meeting on sharks, several tRFMO experts worked as independent reviewers or experts in SCRS meetings.
4.2	Strengthen linkages and collaboration with ICES	Number of meetings with joint participation of ICES-ICCAT	Secretariat	Secretariat staff collaborated with ICES, MOU signed.
4.3	Collaborate with a peer- reviewed journal to enhance communication of SCRS science products to the scientific community	Partner with at least one peer-reviewed annual publication	Secretariat	Memorandum with ALR active, but contributions from SCRS very limited.

4.4	Promoting the dialogue and communication between CPCs in order to carry out scientific research on ICCAT fishery resources in a coordinate and efficient way	Full utilisation of the Scientific Capacity Building Fund (SCBF) throughout the period of the plan. 10 collaborative papers on a regional scale to be submitted to the SCRS groups.	Secretariat	??
5.1	Broad dissemination of the results of the SCRS work to the society as a whole	A mechanism in place by 2020	SCRS Chair	Competitive Research Programme includes proposal for Communication specialist
6.1	Work on the Ontology of the durability of tuna fisheries in the epipelagic ecosystem	No measurable target has been identified	Unknown	No progress

PART BUILI	ICIPATION AND CAPACITY DING			
Goal	Objective	Measureable targets	Reporting responsibility for targets	Notes on measurable targets
1.1	Avoid conflict of interests and ensure the independence of the scientific process	Code of conduct of the SCRS by 2016	SCRS Chair	Not started
2.1	Increase the capacity of the CPCs in meeting data-related obligations	20% reduction in Secretariat's annual report on statistics list of specific data elements that are lacking for each stock over a 5-year span.	Secretariat	Improvements in data continues. See Sec. Report on Stats. and Coord. of Research.
2.2	Increase the ability of the SCRS in the application of methods used in providing management advice on tuna stock management	5 courses are conducted and the training materials are openly available on the website.	Secretariat	VPA course 2017. Training material not available in the Web.

3.1	Ensure the participation of scientists from those CPCs that harvest significant portions of the stock	100% participation of the CPCs that harvest significant portions of the stock.	Sp WG	Some progress but remains an issue in some groups. Often driven by political situation in individual countries. Travel fund from ICCAT always available.
3.2	Increase scientific leadership for SCRS by scientists from G77 economies	<i>At least 30% of the SCRS officers belong to G77 countries.</i>	Secretariat	Currently 6 out of 17, Côte d'Ivoire (1), Morocco (1), Brazil (2), Senegal (1), Uruguay (1).
3.3	Increase scientific participation in SCRS by scientists from G77 economies	33% increase in scientific participation at the SCRS by scientists from G77 economies. Supplementing travel/participation funding: 10 participations funded per year. Long-term training of at least 6 scientists from G77 economies. Initiate 3 collaborative projects with the involvement of scientists from G77 economies.	Secretariat	Many more than 10 participations per year. Scientists from G77 participating in AOTTP. Long term training for more than 6 G77 scientists.

RESEA	ARCH PRIORITIES			
Goal	Objective	Measureable targets	Reporting responsibility for targets	Notes on measurable targets
1.1	Identify the major uncertainties affecting management advice and the type of research needed to address them	Metadatabase for fishery, biological and mark recapture data. At least one cooperative SCRS or peer reviewed research paper for each main specie identifying the main sources of uncertainty and ranges for different (e.g. biological) parameters.	WGSAM and Groups	Significant progress will be made for tropical tunas and has been done for bluefin tuna and albacore as a result of development of MSE.
1.2	Quantification of the relative importance of the different uncertainties and prioritisation of future research	Simulation approach developed for each main species. At least one collaborative SCRS or peer reviewed research paper describing the relative merits of different research actions, for each main species.	WGSAM	Simulation framework developed for MSE can be applied to this.
2.1	Get accurate biological knowledge on stock structure, migrations and life history (growth, maturity, fecundity, maternal effects, etc.	Development of peer reviewed papers describing new biological findings.	Sp WG	Significant progress made for BFT and BSH and SMA.

3.1	Develop measures of fishing capacity and standardized fishing effort for different fleets	Develop SCRS documents and WGSAM reports on the methodologies to quantify fishing capacity and standardised fishing effort. EFFDIS database expanded to PS, GN and other gears, available at the website.	Sp WG	EFFDIS completed for longline.
3.2	Further improve standardization of CPUEs for their use as reliable indices of abundance	SCRS or peer reviewed paper on best practices to standardize CPUEs of different nature. Peer reviewed paper on the use of floating objects to monitor relative abundance.	WGSAM	Work on best practices for CPUE standardization of longline well advanced through WGSAM and by ECOFAD on purse seine.
4.1	Increase availability of fishery independent information to improve stock assessment and monitor the effect of management regulations	Development of report about dedicated workshop with specific recommendations on how to move forward. Increased number of peer reviewed and SCRS papers with the outcomes of fisheries independent research surveys. Develop and document experimental designs for mark-recapture surveys of key ICCAT species.	SCRS Chair	BFT Larval index used in assessment. Design of AOTP tagging based on simulation work.
5.1	Develop guidelines and robust methodologies that can cope with a range of different situations, including data poor ones	Identification and/or development of SCRS or peer reviewed papers on best practices and robust methodologies.	SCRS Chair	SCRS papers and peer review papers on data poor methods. BFT framework includes many data poor methods.

6.1	Quantify the effects of adopted as well as potential alternative management measures	Development of SCRS and peer review papers with the effects of existing and alternative management measures/strategies.	Sp WG	Many SCRS papers on MSE, still to complete peer review papers.
7.1	Identify and fill knowledge gaps so as to be able to provide scientific advice including ecosystem considerations (e.g. assessment of by-catch species, mitigation strategies, environmental effects on population dynamics, fishing impacts on the ecosystem, socio economic aspects, etc.)	Development of WG reports with specific Research Plans. Increasing number of people by research discipline participating in the SCRS.	Sp WG	Ecosystem Sub-committee starts to integrate indicators of stock status from other groups. WGSAM focuses on integrating environmental indicators in assessment.
STOC	K ASSESSMENTS AND ADVICE			
Goal	Objective	Measureable targets	Reporting responsibility for targets	Notes on measurable targets
1.1	Integration of the different forms of uncertainties (e.g. natural variability and or lack of knowledge) in status diagnoses and projections	Development of a more standardised Terms of Reference for the Data Prep Meetings (and Assessment meetings?) that include a more complete analysis of the advice and uncertainty from the previous assessment. Further evaluate the quality of the fisheries data and related to the knowledge of the species.	WGSAM	Not yet started

1.2	Provide scientific advice using methods of analysis that are appropriate for the amount of information available for a given stock	Conduct a meeting between the Commissions and CPC to discuss the future roles of the CPCs and the Secretariat in future assessments.	SCRS Chair	Not yet started, depends a lot on progress on MSE.
1.3	Consolidate the stock assessment catalogue to ensure the best use of models that should be fully documented	Reactivate the Working Group of the Stock Assessment Catalogue and review the protocols of inclusion and updating the software used for stock assessments while maintain a historic repository of version control.	Secretariat	Collaborated with ICES in promoting historic repositories of assessment data. Implemented data rapporteur in SCRS assessments.
1.4	Improve Stock Assessments by incorporating improved information on fishery and life history characteristics	A written plan of how the data will be collected, stored, shared, and utilised and for exactly what purposes by 2015. Use an MSE approach to quantity the sample sizes needed to improve the information.	Sp WG	Collaborating on a Global MSE work to see the value of sharing information across ocean basins.
1.5	Strengthen peer review process	Conduct a peer review of at least one assessment each year.	Secretariat	No peer review in 2016 but one in 2017.

2.1	SCRS should continue to evaluate precautionary management reference points and robust harvest control rules through management strategy evaluations	Establish a 5 year schedule for the establishment of species specific HCRs which will include a default HCR in the absence of species specific information. Produce a review of MSE efforts so far in light of successes, lack of successes and the resources limiting future MSE progress and to collate feedback from managers and stakeholders on the process thus far.	SCRS Chair	See SCRS/2016/075
2.2	Provide advice on the setting of precautionary approach and harvest control rules to avoid overfishing and decline of stocks as well as rebuild overfished and depleted stocks.	Establish a 5 year schedule for the establishment of species specific HCRs which will include a default HCR in the absence of species specific information. Advocate the establishment of a standardised precautionary approach limit to be used as a default in the absence of more specific limits. Conduct at least one workshop on the use of MSE to evaluate harvest control rules to be held jointly with other RFMOs.	SCRS Chair	See SCRS/2016/075
3.1	Focus on the fishery and its role in the ecosystem, including the commercial and non-commercial species as well as the habitat.	Create a proposal of possible EBFM goals and objectives to the Commission referring to those currently used by other RFMOs that are further along in this process. Support a post-doc or similar position to establish as ecosystem (multi-species, multi-functional group) operating model that can be used to test the aforementioned hypotheses.	Sub-Com Eco	Collaborated with ABNJ and other RFMOs to review EBFM implementation. Proposal provided to SCRS and Commission during Dialogue meetings. Post- doc supported by EU project.
3.2	Support a post-doc or similar position to establish as ecosystem (multi-species, multi- functional group) operating model that can be used to test the aforementioned hypotheses.	Host a workshop and invite outside expertise to collaborate with the Sub-Committee of Ecosystems to determine an effective approach to the creation of an ESR. In line with other RMFO, compilation of an Ecosystem Status Report that describes the current state and trends in selected ecosystem indicators for communicating this information to participating scientists and managers.	Sub-Com Eco	Meeting of tRFMO held in Dec 2016 Ecosystem Report Card under development.

3.3	Develop short term, medium and long-term objective to enhance ecosystem based approaches	Conduct a meta-analysis of year/area effects on ICCAT species abundance with the goal of determining historic and recent changes in the spatial distribution of these species, possible regime shifts in productivity, and other relevant characterisations.	Sub-Com Eco	Slow progress
4.1	Development and testing of bio- economic modelling approaches and Identification of data needs	Protocol to collect bio-socio-economic information.	Sub-Com Stat	Dialogue meeting failed to advance the question of whether the Commission is interested in the SCRS/Secretariat being involved in the collection and analysis of Socio-economic information.
4.2	Development and test bio- economic modelling approaches	Creation of a plan to apply bio-socio-economic modelling approaches.	Sub-Com Stat	Dialogue meeting failed to advance the question of whether the Commission is interested in the SCRS/Secretariat being involved in the collection and analysis of Socio-economic information.

### Discussion

The Committee thanked the SCRS Chair for reviewing the status of the plan and suggested that in 2018 particular attention should be given to prioritisation of the work to be carried out between 2018 and 2020. It was also suggested that the Science Strategic Plan be further developed to the 2020 and 2025 period.

### 18. Consideration of plans for future activities

#### 18.1 Annual Work Plans

The Rapporteurs summarized the Work Plans for 2018 for the various Species Groups, the Working Group on Stock Assessment Methods, the Sub-Committee on Statistics and the Sub-committee on Ecosystems and By-catch. These Plans were adopted and are attached as **Appendix 12**.

#### 18.2 Inter-sessional meetings proposed for 2018

Taking into account the assessments mandated by the Commission and the Committee's recommendations for research coordination, the proposed intersessional meetings for 2018 are shown in **Table 18.2**. The Committee noted that the schedule needs to maintain some flexibility in order to account for any changes that may result from the deliberations held by the Commission in November 2017 and the meetings scheduled by other RFMOs.

The European Union put forward an invitation to host the bigeye tuna stock assessment.

#### 18.3 Date and place of the next meeting of the SCRS

The next meeting of the Standing Committee on Research and Statistics (SCRS) will be held in Madrid, Spain, from 1 to 5 October 2018; the Species Groups will meet from 24-28 September 2018 at the ICCAT Secretariat (Madrid, Spain).

#### **Table 18.2.** Proposed calendar of ICCAT scientific meetings in 2018.

The MSE (BFT & N-SWO) meeting schedule is tentative, pending on the agreement among the ICCAT GBYP Core Modelling Group members.

### 19. General Recommendations to the Commission

### 19.1 General recommendations to the Commission that have financial implications

#### Eastern and western Atlantic bluefin tuna

• The collection of hard parts and other tissue samples needs to be improved considerably. The Committee recommends that all CPCs institute biological sampling programmes designed to collect an adequate number of tissue samples in a representative fashion from all fishing fleets, and that the Commission establish an ad hoc working group to help coordinate those programmes. Consideration should be given to conducting an ageing workshop.

#### Albacore

- The Committee recommended that an independent peer-review of the MSE process and code used in setting the MP would be useful to get external approval on what has been done with the current (North Atlantic albacore and Atlantic bluefin tuna) and future MSEs being proposed (e.g. swordfish and tropical tunas). Possible candidate approaches would be the model used for CCSBT/IOTC with external reviewers from the field evaluating the procedure and technical modules used to design and evaluate the process. This would be of high priority for the albacore MSE and should be undertaken within the next few years. The Committee recommends that the Secretariat approaches the ABNJ project to inquire about the possibility of financial assistance.
- The Committee continues to recommend initiating an albacore research programme for North Atlantic albacore. Over a four year period, the research will be focused on three main research areas: biology and ecology, monitoring of stock status, and management strategy evaluation. The requested funds to develop this research plan have been estimated at a cost of 1.2 million Euros for a four year work plan. More details of the proposed research and economic plan are provided in the 2018 albacore work plan (**Appendix 12**).
- During the most recent series of scientific meetings of the Albacore Species Group, several countries with important albacore fisheries have not been represented at the meeting. This limited the ability of the Group to properly revise the basic fishery data and some standardized CPUEs that were submitted electronically. This continues to result in unquantified uncertainties, which affected negatively achieving the objectives of the meetings. To overcome this, the Committee continues to recommend that CPCs make additional efforts to participate and be made aware of capacity building funds available for participation in and contributing to Working Group meetings.

### Tropicals

- The Committee recommends that, the combined historical "FIS" fishery (FRA+CIV+SEN, before 1991) be split in Task II (T2CE and T2SZ/CAS) and allocated to the respective CPC in the line of what was made in Task I catches in the past. The same break down is required (T2CE and CAS) for the combined tropical ETRO fisheries (NEI-ETRO combined fleet) affecting mainly purse seine before 2006. This task should be achieved before the next tropical tuna assessment.
- Bearing in mind that there is funding available to improve the Ghanaian statistics, the Committee reiterates the need for scientists from EU and Ghana to collaborate to adapt the T3 software, and encourages capacity building activities in African countries, particularly for Ghanaian scientists.

#### Billfishes

• In the recent marlin and sailfish stock assessments, it was indicated that one of the major uncertainties was in the catch estimates reported to ICCAT. It is suspected that small scale fisheries across the region are responsible for a portion of the unreported catches (SCRS/2014/043). Noting that in 2014, the Commission funded a strategic investment inventory for artisanal fisheries in West Africa contributing to reduce these uncertainties. The endeavor needs completion. Thus, it is a very high priority to conduct a comprehensive analyses of species-specific billfish catch and effort statistics from small scale (or artisanal) fisheries for both CPCs and non-CPCs operating in the

western Atlantic, specifically in the Caribbean region where important artisanal fisheries target billfish species. The terms of reference for this endeavor are detailed in the 2018 billfish work plan.

- Noting the success of the recent sailfish CPUE standardization workshop, the Committee recommends that a similar workshop should be held for the proposed 2018 blue marlin stock assessment.
- During the 2011 blue marlin stock assessment an alternative model approach provided added confidence to the Committee determination of stock status. Consequently, the Committee expressed continued interest in exploring multiple model approaches, that fully exploit the currently collected data, and recommends that the Secretariat continue to support external expertise to assist the Committee with its modelling work using other modelling platforms, in preparation for the 2018 stock assessment.

#### Sharks

- *Porbeagle:* to be assessed in 2019; has large data gaps; important to start projects immediately so that results can be used in 2019 stock assessments (€30,000 for reproductive biology studies; €60,000 for movement, stock boundaries, and habitat characterization studies).
- *Shortfin mako:* first three years of SRDCP devoted to it; however, there will still remain uncertainties on some important biological parameters; genetics study to be completed with additional samples from the Mediterranean (€10,000).

#### Small tunas

- Continue with the ICCAT SMTYP Research Programme activities in 2018-2019 to further improve the biological information (growth and maturity) for the priority species (the details of this programme are given in the small tunas work pan for 2018-2019 (**Appendix 12**).
- The CPCs should make the necessary arrangements to ensure a large participation of their National scientists in the small tunas species group meetings (both intersessional and species group meetings).
- Extend the species description chapter (*ICCAT Manual*) for other small tuna species such as wahoo (*Acanthocybium solandri*), serra Spanish mackerel (*Scomberomorus brasiliensis*), West African Spanish mackerel (*Scomberomorus tritor*) and dolphinfish (*Coryphaena hippurus*), and if possible update of all other species chapters which were last updated in 2006, except for *Thunnus atlanticus*, which was updated in 2013.

# North and South Atlantic swordfish

- To SCRS plenary on research funding for a stock structure study. Given new information on genetics, satellite archival tagging and early life history studies that has become available, and the uncertainties in the swordfish stock boundaries (N vs South, N vs Mediterranean, Atlantic vs Indian Oceans), the Committee recommends synthesizing existing information, and collecting additional critical new data (including tissue samples, size, sex and maturity information), in order to properly identify stock composition within the areas identified as mixing zones. The costs for the initial part of the study would be €180,000, specifically €80,000 for a population genetics study and €100,000 for the deployment of approximately 20 popup satellite archival tags. Such costs could be spread over a two year period as follows: €100,000 in 2018/2019 and €80,000 in 2019/2020. This recommendation applies to both the North and South Atlantic and Mediterranean stocks.
- *To SCRS plenary on the MSE timetable and funding*: Delivering MSE results for northern swordfish according to the schedule agreed upon by the Commission will be very challenging and require time and resources that are not presently available to the Group. The Committee recommended that the funding for the MSE for swordfish should be in addition to a proposed strategic research fund for the SCRS and that a detailed proposal to support the agreed North Atlantic swordfish MSE timetable, including costs, should be developed by the SCRS and presented to the Commission. The

Committee expressed concern over the existing timeline for provision of the MSE to the Commission. This concern should be addressed in the proposal. Ideally such proposal would integrate the needs to conduct an MSE for tropical tunas, because it is likely that many CPC scientists would have to be involved in both, and draw on the experience of the albacore MSE.

#### Mediterranean swordfish

- Stock mixing and management boundaries: The Committee noted the need to further improve the current knowledge about stock boundaries between the Mediterranean and North Atlantic swordfish stocks. For this purpose, it was recommended to conduct collaborative and multidisciplinary research, including population genetics, electronic tagging, life history, and to use fine-scale (e.g. 1<sup>o</sup> squares) and quarterly sampling strata.
- Data recovery plan: The Group noted that the catch and CPUEs time series currently in use in the stock assessment models start in 1985. Therefore the early period of the fisheries, which accounted to increasing catches is not being accounted in the model. As such, the Committee recommended conducting a recovery of historical data, so that the entire history of the fishery is taken into account in the stock assessment models. Particular effort should be dedicated to collecting available information from the major fisheries of the early years, especially EU-Italy fisheries.
- Size and age at maturity: As there are ecological differences between the East and West Mediterranean, the Committee recommended that future work is conducted to explore possible differences in swordfish life-history at the spatial scale.
- Habitat use and availability to the different gears: The Group recommended the use of satellite tagging to provide information on habitat use for comparison of the availability of swordfish to the various fisheries, including comparisons between traditional and meso-pelagic longlines.

#### Sub-committee on Statistics

• The Committee recommends that the Commission provides the Secretariat with all the support needed to complete the online reporting system. In addition, the Committee recommends that the Commission 'Online reporting Working Group' be expanded to include members of the SCRS and statistical correspondents.

#### Sub-committee on Ecosystems and By-catch

With regard to Ecosystems:

• Given the large amount of work involved in implementing ecosystem based fisheries management in ICCAT and implementing related products such as Ecosystem Overviews, Ecosystem Assessment Reports and Ecosystem Report Cards, the Committee recommends that €20,000 of financial support be provided to support an external contractor to expedite this process.

With regard to by-catch:

• The Committee requests financial assistance to support the attendance of three to five CPC scientists during the seabird assessment process of ICCAT.

#### 19.2 Other recommendations

#### Eastern and western Atlantic bluefin tuna

• Noting the divergent trends in the handline indices from the western Atlantic Ocean and the potential role of environmental factors, the Committee recommends that effort be directed towards both identifying environmental factors that affect catchability at basin and local scales and incorporating these factors in the index standardization. The potential for combining the data and creating a joint handline index should also be explored.

• The Committee recommended that paired hard parts be collected in both the East and West to help estimate the bias across all ages. Furthermore that production aging of the backlog of eastern and Mediterranean otoliths focus primarily on the gaps in size and spatio-temporal fishery(ies) representativeness. The effect of bin-size on age-length keys construction should be investigated.

#### Albacore

- The Committee recognized the lack of standardized CPUE data from the eastern Mediterranean as a potential source of uncertainty when assessing Mediterranean albacore. The Committee recommended the CPCs predominantly fishing in this area (EU-Cyprus, EU-Greece and Turkey) make a concerted effort to generate, and submit, standardized CPUE data. Likewise, the Committee supports the continuation of larval index data collection in the Balearic Sea and other spawning areas, and recommends further research into the use of larval indices to supplement fisheries dependent data in stock assessments. As for Atlantic albacore, the Committee recommended that the feasibility of joint South Atlantic albacore CPUE analyses for longline fleets (Brazil, Chinese Taipei, Japan and Uruguay) using fine scale, operational level data be explored, and to continue efforts to produce new standardized CPUE series from swordfish directed pelagic longline fisheries throughout the Atlantic.
- The Committee recommends to conduct a review and collation of all the available data on agelength from the various studies that have estimated age from spines with the view to update the estimate of the growth curve for Mediterranean albacore. It is also recommended that methods of accounting for selectivity in the year 1 cohort in von Bertalanffy growth function (VBGF) be explored to ensure accurate parameter estimation.

# North and South Atlantic swordfish

- To the WGSAM on CPUE standardisation methods. For the WGSAM to provide guidelines on how and when to include interactions between years and other factors in the CPUE standardization. Also how to account for targeting effects (e.g. catch ratios, clustering of catch composition and other alternatives). To ask for guidance on how to interpret measures of variance associated with the index in the presence of different model structures, especially in the context of the use of these measures of variances in the process of population modelling (e.g. in the weighting of different CPUEs).
- *To CPCs on submission of data for use in the stock assessments.* All data to be used in the assessment, including Task I and II data, including discards and, when possible live releases, standardized CPUE series, new biological information, etc., should be available at least one week in advance of the data preparatory meetings.
- *To CPCs on target species.* All fleets should record detailed information on log records to quantify which species or species-group is being targeted. Compilation of detailed gear characteristics and fishing strategy information (including time of set) are very strongly recommended in order to improve CPUE standardization.

# Mediterranean swordfish

• *Discards.* Recently adopted management measures may have increased discard levels, therefore the Committee noted that participating countries should improve their estimates of discards of juvenile swordfish, not only from the swordfish targeting fisheries but also from the albacore ones, and submit such information to the ICCAT Secretariat.

# Tropicals

- Regarding the AOTTP:
  - The Committee recommends increasing the tag-seeding efforts, and noted that 4,500 tags were recommended by the AOTTP feasibility study for tag-seeding activities (e.g. 5-15 fish per trip). The Committee recognized that it is desirable to determine the tag reporting rates for all major gear types, and by main fishing area and/or landing port. The Committee also noted that tags should have metallic barbs since plastic dart tags often fall out when applied to dead fish.
  - The Committee strongly recommends additional efforts to improve recovery rates of tagged fish in the longline fleets, in particular Brazil, Canada, Chinese-Taipei, Japan, Mexico and the United States and EU. The Committee recommends that AOTTP personnel contact national observer programme coordinators to make them aware of the programme.
- *Observer coverage:* The Committee recommends increasing the minimum level of observer coverage to 20%. Noting that EMS can complement physical observer programmes and also collect other data that would be useful to the SCRS, the Committee considers that it would be useful to ensure that the different systems available conform to harmonized installation, data collection and reporting protocols, so as to ensure compatibility.

# Billfishes

- Noting the severe challenges in interpreting and fitting indices within stock assessment models, it is recommended that National scientists of all CPCs coordinate their work to consider how to reconcile divergent CPUE patterns that may be a function of changes in fleet spatial distribution, oceanography, and/or targeting. Therefore, it is recommended that future assessments of billfish stock status include combined indices of fleets with similar operational characteristics, or that estimated indices be area specific indices of abundance.
- There is a need for research for determining levels of billfish post release mortality, so that the full effects of discards can be included in future stock assessments.

# Sharks

- The WGSAM should develop guidelines and criteria for evaluating the plausibility of model scenarios, including model diagnostics that could lead to accepting or rejecting model results.
- Ask CPCs to provide catch statistics (including Task I, Task II, CPUE, and dead and alive discards) of all ICCAT fisheries, including recreational and artisanal fisheries, and to the extent possible non-ICCAT fisheries, capturing pelagic species. Renewed call for electronic and conventional tagging data to all CPCs conducting such research in the Atlantic.

# Small tunas

- Statistical Correspondent and/or National scientists should revise, update, complete and submit their small tuna T1NC series to the Secretariat. This revision should take into account, the replacement of the carry overs, the split of "unclassified" gears by specific gear codes, and the completeness of Task I gaps identified.
- The Committee requests the help of the WGSAM in order to implement simulations to evaluate the robustness of candidate data-poor methods being proposed for providing management advice for small tunas. The Committee is also interested in using simulations to evaluate how to reduce uncertainty by improving specific fishery and biological data on small tunas. The WGSAM should also investigate the benefits and constraints of an approach based on multiple data poor methods, including providing guidance on how to provide statistical weights to the results of different methods for the purposes of combining all results into one. Furthermore, the Committee seeks the help of the WGSAM and the Secretariat in providing guidance about the reliability of the algorithms

used in the R-framework used for data poor methods. Specifically, the Committee wants to know whether the WGSAM thinks that these algorithms have been sufficiently tested and reviewed, in spite of the fact they are not currently part of the ICCAT software catalogue.

#### Working Group on Stock Assessment Methods (WGSAM)

- *Albacore* The Committee recognizes the need to incorporate environmental studies in albacore and other species assessments. The Committee was exposed to new information suggesting that the mixed layer depth might impact catchability of surface fisheries. The Committee recommends further research to confirm this, as well as to inspect sources of historical environmental information that might help integrate this information in CPUE standardizations of surface fisheries.
- *Sailfish* Noting the severe difficulties in interpreting and fitting indices within stock assessment model, the Committee recommends work to consider how to reconcile divergent CPUE patterns that may be a function of changes in fleet spatial distribution, oceanography or targeting.

#### Sub-committee on Ecosystems and By-catch

With regard to Ecosystems:

- It is recommended that in future Species Working Group meetings there be a meeting between the Working Group Chairs and the Ecosystem Sub-Committee Conveners in order to discuss ecosystem related issues.
- Given the need to communicate the status of the unassessed and non-retained species caught by ICCAT fisheries as well as other components of the ecosystem that play a role in supporting the fisheries, the Committee recommends that the SCRS include an Executive Summary of the outcomes of the ecosystem assessments in the annual report of the SCRS.
- It is recommended that the next meeting of the Dialogue between Scientists and Managers Working Group (SWGSM) include an agenda item on the development of Ecosystem Report Cards to support the implementation of an EBFM framework for ICCAT.

With regard to by-catch:

- The Committee acknowledges that large circle hooks are proven to be effective in reducing sea turtle by-catch and might also increase post-release survival. The Committee also acknowledges that circle hooks have different impacts on both target and by-catch species. While they decrease marlin by-catch and swordfish catch rates, they increase tropical tuna and sharks catch rates. Taking into consideration the above scientific information, and that most sea turtle by-catch occurs on shallow longline sets, the Committee recommends the Commission to consider adopting for longline fisheries targeting swordfish and sharks at least one of the following mitigation measures:
  - the use of large circle hooks;
  - the use of finfish bait;
  - $\circ$   $\,$  other measures considered effective by the SCRS.
- The Committee encourages National scientists to evaluate the overall impact of adopting mitigations measures on the management of the large pelagic fish community.

#### Sub-committee on Statistics

• The Committee reminds CPCs of their obligation to report total discards and live releases. The Committee also recommends that the SCRS explores ways to provide capacity building to those CPCs that need it to comply with the discard reporting requirements.

• The Committee recommends that the Commission provides the Secretariat with all the support needed to complete the online reporting system. In addition, the Committee recommends that the Commission 'Online reporting Working Group' be expanded to include members of the SCRS and Statistical correspondents.

#### 20. Responses to Commission's requests

The Committee noted that some of the 2017 Responses to the Commission's Request have been carried over for several years running without a response from the Commission. The Committee recommends that a check list of Annual Responses to the Commission be prepared and submitted to the Commission. The Commission is requested to define which requests remain active for the next year (along with any further elaborations on the request) and which requests no longer require a response.

# 20.1 Ghana's comprehensive and detailed capacity management plan on the level of catches. Rec. 16-01, paragraph 12c

**Background**: [Rec. 16-01], paragraph 12c. Ghana shall be allowed to change the number of its vessels by gear type within its capacity limits communicated to ICCAT in 2005, on the basis of two baitboats for one purse seine vessel. Such change must be approved by the Commission. To that end, Ghana shall notify a comprehensive and detailed capacity management plan to the Commission at least 90 days before the Annual Meeting. The approval is notably subject to the assessment by the SCRS of the potential impact of such a plan on the level of catches.

According to Rec. 16-01, Ghana is permitted to change the number of its vessels by gear type within its capacity limits communicated to ICCAT in 2005, on the basis of two baitboats for one purse seine vessel subject to the assessment by the SCRS of the potential impact of that plan on the level of catches. According to the ICCAT List of vessels over 20m, 17 purse seiners, 20 baitboats and 2 carriers were operated by Ghana in 2016.

The Group considered whether it was possible to determine if the fishing capacity by vessel gear type (i.e. purse seine, baitboat) remains consistent with the intent of Rec. 16-01, paragraph 12. The Secretariat confirmed that the data sets required to conduct that analysis have been submitted by Ghana, but noted that additional work is required to combine the datasets into a single format that can be used to support the necessary analyses. This work could not be conducted in time to respond to the Commission in 2017. The Group recommended that the Secretariat compile the data needed to support the analysis of Ghanaian fishing capacity in time to conduct these analyses in 2018.

# 20.2 Evaluate the efficacy of the area/time closure referred to in paragraph 13 in relation with the protection of juveniles of tropical tunas. Rec. 16-01, paragraph 15

**Background**: [Rec. 16-01] paragraph 15. As soon as possible and at the latest by 2018, the SCRS shall evaluate the efficacy of the area/time closure referred to in paragraph 13 for the reduction of catches of juvenile bigeye and yellowfin tunas. In addition the SCRS shall advise the Commission on a possible alternative area/time-closure of fishing activities on FADs to reduce the catch of small bigeye and yellowfin tuna at various levels.

The current area/time closure was implemented for the first time in 2017. Although an analysis of preliminary 2017-Quarter 1 Task II data for the EU and associated fleets was presented to the Group, the Group noted that the official 2017 fisheries data are not required from CPCs until 31 July 2018. Therefore, the Group was not able to conduct analyses using the full dataset. Furthermore, additional years of data (beyond 2017) would be required to adequately assess the result of the closure, and those data will not be available until after the deadline provided by the Commission.

However, this year the SCRS reviewed historical data (2000-2012) to compare the catch from the area covered by the 2013 closure and the catch from the area covered by the current closure. The difference in FAD-associated bigeye catch between the two areas was minimal. In the SCRS response to the Commission in 2015 that addressed the efficacy of the 2013 closure, the Committee concluded it had not been effective in reducing the catch of juvenile bigeye and yellowfin to a measurable degree. As a result of the similarity in historical catch levels in the two areas, the analyses suggested that the 2017 closure would not be more effective than the 2013 closure.

Committee plans to conduct an evaluation of the effect of the moratorium on the mortality of juvenile tropical tunas in 2018. The work plan will include the elements listed below.

- 1. For addressing the request of the Commission on "alternative area/time closure of fishing activities on FADs to reduce the catch of small bigeye and yellowfin tuna on various levels" (Rec. 16-01 and 16-15), the Secretariat in collaboration with EU and Ghana scientists, coordinates the assembly of data required at the highest resolution possible, with information of catches, catch composition, size distribution, geographic (1x1) and monthly distributions of catch of tropical tunas from the main purse seine fleets. Additional data can be gather from the current AOTTP programme. The AOTTP Coordinator will collaborate with the SCRS Chair, and tropical species group leads to facilitate the inclusion of AOTTP data in the stock assessment of bigeye and the moratorium analyses to the extent possible.
- 2. Using data through 2016:
  - a) Examine the catch, effort and size frequency (Task II) of yellowfin and bigeye tuna landed by surface fleets in the tropical Atlantic by 1x1 grid and month.
  - b) Analysis of the historic surface fleet using purse seine fishery data in relation to the environmental parameters.
  - c) Evaluate time/area closures that could achieve certain percentage reductions (10% to 50%) in the annual catches of juvenile yellowfin and bigeye tuna.
  - d) Provide information on how these reductions will affect the projected stock status (i.e. SSB/SSB<sub>MSY</sub> and F/F<sub>MSY</sub>) and recovery schedule, and other measures as possible (e.g. YPR, SPR).

# 20.3 Review its 2016 recommendations on observer coverage and advise the Commission on appropriate coverage levels. Rec. 16-01, paragraph 42

**Background:** [Rec. 16-01] paragraph 42. In 2017 the SCRS shall review its 2016 recommendations on observer coverage and advise the Commission on appropriate coverage levels for each tropical tuna fishery, taking in consideration the full suite of monitoring tools in the fishery.

In the SCRS response to the Commission in 2016 on observer coverage it was noted that several studies (Lennert-Cody, 2001; Babcock *et al.*, 2003; Sánchez *et al.*, 2007; Amandè *et al.*, 2012) suggest that sampling coverages of, at least, 20% would be necessary to provide reasonable estimates of total by-catch and the by-catch of common species. In the case of rare species, this percentage would need to be much higher at least 50% (Babcock *et al.*, 2003). Thus, the SCRS continues to conclude that current required level of scientific observers (5%) seems to be inappropriate to provide reasonable estimates of total by-catch and recommends increasing the minimum level to 20%. Ideally analysis of by-catch rates should be fisheries specific and done by CPC scientists responsible for the observer programmes as recommended by the Sub-Committee on Ecosystems. However the Committee noted that the catch of common by-catch species that needs to be reported is already required under Rec. [03-13].

The SCRS reiterates also its recommendation from 2016 on Electronic Monitoring Systems (EMS) which are already being used by some tropical tuna purse seine vessels. Noting that EMS can complement physical observer programmes and also collect other data that would be useful to the SCRS, the Committee considers that it would be useful to ensure that the different systems available conform to harmonized installation, data collection and reporting protocols, so as to ensure compatibility. The Committee recommends that tropical tuna purse seine fleets or CPCs wishing to voluntarily implement EMS follow the guidelines described in Ruiz *et al.* 2017. This source of information would help improve current coverage of observer data in tropical tuna fisheries.

Information relevant for the preparation of this response was only made available for the tropical tuna purse seine fishery which currently has the highest observer coverage amongst ICCAT fleets. As a result, this response is limited to this fishery. It is noted, however, that longline fisheries also target tropical tunas and may have high by-catch rates but this information was not made available to the Working Group. Baitboat fisheries also target tropical tunas, although by-catch is generally thought to be small, but this

information comes from landings, not observers. Artisanal fisheries including gillnets/troll and handline also catch tropical tunas while fishing for other species, but by-catch information for these fisheries are extremely limited and come only from landings. Some of the more general points in this response, such as on reducing tuna discards, can also be applicable to these fisheries.

# 20.4 Recommendations made by the FAD Working Group (Annex 8) and develop a work plan. Rec. 16-01, paragraph 49 (a)

**Background:** [Rec. 16-01] paragraph 49(a). At its 2017 meeting the SCRS shall address to the extent possible the Recommendations made by the FAD Working Group in 2016 (Annex 8) and for the remaining ones develop a work plan to be presented to the Commission at its 2017 Annual meeting.

During the 2017 meeting of the tropical tuna Species Group recommendations made by the FAD working group in 2016 were considered, but not those developed by the FAD working group in 2017.

Some actions recommended by the FAD working group in 2016 have already been incorporated into the work plans of the SCRS Tropical Tuna Species Group and Sub-Committee of Statistics. The SCRS, however, has not yet developed a work plan to comprehensively address all the recommendations of the Ad hoc Working Group on FADs. Although many of these actions are relevant to the Tropical Tuna Species Group, others are relevant to the Billfish and Sharks Species Groups and the Sub-Committees on Ecosystems and Statistics. The SCRS Chair, with the help of the rapporteurs of tropical tunas, billfish, sharks, Sub-Committees on Statistics and Ecosystems will prepare, before the end of 2017, a FAD research work plan to coordinate the SCRS response to the recommendations made by the ICCAT FAD working group. This work plan will be reviewed by the appropriate working groups and subcommittees during the intersessional meetings in 2018 and reviewed by the SCRS in plenary in 2018.

# 20.5 Provide performance indicators for skipjack, bigeye and yellowfin tuna, with the perspective to develop management strategy evaluations for tropical tunas. Rec. 16-01, paragraph 49 (b)

**Background:** [Rec. 16-01] paragraph 49(b). At its 2017 meeting the SCRS shall provide performance indicators for skipjack, bigeye and yellowfin tuna as specified in Annex 9, with the perspective to develop management strategy evaluations for tropical tunas.

After reviewing the indicators developed by ICCAT and those developed by other tRFMOs, the Group agreed that performance indicators developed for North albacore (see *Report of the Second Intersessional meeting of Panel 2*, Anon. 2017b) can be used as an initial list for tropical tunas and that the future of MSE simulation framework should be able to calculate all of them.

The Group noted that the summary advice to the Commission should use only one indicator for each of the main categories, as was the case for northern albacore. These four specific indicators selected for tropical tunas are likely to be different than those used for albacore because there is at least one stock (bigeye) that needs rebuilding. It is therefore important to select one indicator that helps evaluate the success of rebuilding. These summary indicators can be different for different stocks.

The Group agreed that it would be better if indicators that reflect recruitment overfishing and growth overfishing were also incorporated to the list as has been proposed by the SCRS for swordfish. This relates to the fact that, in the past, the Commission has expressed that they are concerned about the sizes of fish that are caught and how these sizes affect maximum sustainable yield.

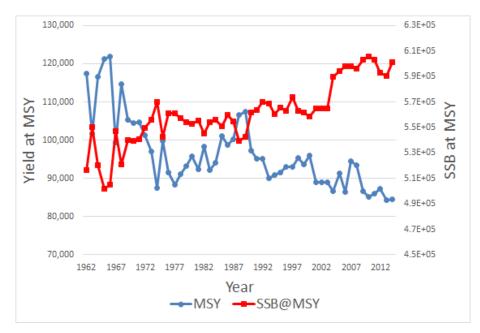

Although the Group agreed that it would be ideal to have some performance indicators relating to multispecies considerations it would need guidance from the Commission on what multispecies objective(s) the Commission has, if any. These indicators would need to be derived in a way that takes care of fishery, interactions between stocks and possibly biological interactions. Alternatively, the Commission will have to consider tradeoffs by examining species specific objectives for all stocks at the same time, for example if a single species control rule triggers an action, the action will affect all stocks. In their reports to the Commission the SCRS will provide summaries for each stock and all four indicators, and for each indicator for all stocks.

#### 20.6 Develop a table that quantifies the expected impact on MSY, BMSY, and relative stock status for both bigeye and yellowfin resulting from reductions of the individual proportional contributions of major fisheries to the total catch. Rec. 16-01, paragraph 49 (c)

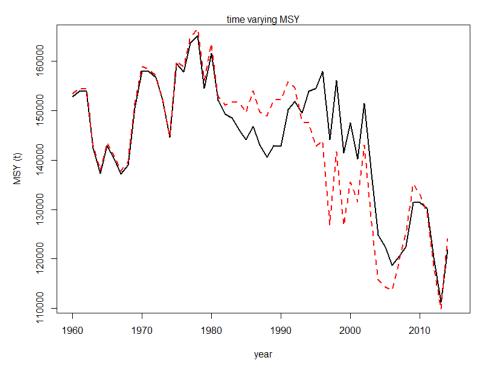

**Background:** [Rec. 16-01] paragraph 49(c). At its 2017 meeting the SCRS shall develop a table for consideration by the Commission that quantifies the expected impact on MSY,  $B_{MSY}$ , and relative stock status for both bigeye and yellowfin resulting from reductions of the individual proportional contributions of longline, FAD purse seine, free school purse seine, and baitboat fisheries to the total catch.

The Group plans to conduct an analysis that will directly respond to this request in 2018 (see the work plan).

The Group also noted that the most recent stock assessments of bigeye and yellowfin tunas demonstrate that current MSY may be below what was achieved in past decades because overall selectivity has shifted to smaller fish (**Figure 1 and 2**). In addition, the assessment of bigeye also indicated that as the potential MSY has decreased over time the spawning stock biomass required to produce this MSY has increased (**Figure 1**). Similar results were reported for analyses conducted on bigeye in the Pacific Ocean (WCPFC-2013–WGTT/10).

**Figure 1.** Year/selectivity specific maximum sustainable yield (MSY) and spawning stock biomass (SSB) required to produce that maximum sustainable yield for bigeye tuna.

**Figure 2.** MSY for yellowfin tuna estimated annually from an age structured stock assessment (SS) using cluster 1 and 2 indices.

# 20.7 Evaluate the contribution of by-catches and discards to the overall catches in ICCAT tropical tuna fisheries, on a fishery by fishery basis. Rec. 16-01, paragraph 53

**Background:** [Rec. 16-01] paragraph 53. The SCRS shall evaluate the contribution of by-catches and discards to the overall catches in ICCAT tropical tuna fisheries, on a fishery by fishery basis and advise the Commission on possible measures allowing to reduce discards and to mitigate onboard post-harvest losses and by-catch in ICCAT tropical tuna fisheries.

Following the ICCAT Glossary the Group consider by-catch to imply species that are not targeted, and discards as all species/sizes that are not retained. In this report, it is assumed that the target of the purse seine fishery are skipjack, yellowfin and bigeye that are landed. For the purpose of this response we are considering this to be the catch of BET+YFT+SKJ that are discarded at sea, plus the catch of all other species (by-catch), whether discarded or not.

According to one recent study on EU purse seine by-catch and discards for 2010-2016, in average, overall by-catch in the purse seine fishery is 113.8 tons and 26.3 tons per every 1,000t of bigeye, yellowfin and skipjack landed in FOB and FSC sets, respectively. An average, 13% of the by-catch results from FSC sets and 87% from FOB sets. The majority of the by-catch consists of tunas: BET+YFT+SKJ that are discarded at sea (21% and 22% in FOB and FSC sets, respectively), and other tuna species<sup>1</sup> that are either retained or discarded (56% and 40% in FOB and FSC sets, respectively) (**Table 1**). While overall by-catch is higher in floating object sets than it is in free school sets, this is not always the case for different species groups. For instance, by-catches of billfishes, sharks and rays are of similar magnitude in FOB and FSC sets (**Table 2**).

<sup>&</sup>lt;sup>1</sup> "The group "Other tunas" consider all tuna species other than SKJ, YFT and BET."

	2010	2011	2012	2013	2014	2015	2016	Average

Turtles	1%	1%	3%	1%	1%	0%	1%	1%

In total 10,184 number of sets were observed during the time period. There were 163 whale shark interactions that were released alive, almost always before the retrieval of the net. 202 cetacean interactions (13 dolphins, 189 whales) were reported by observers during the whole studied period the majority (177) of which were in Free School Sets. All of them were released alive, almost always before the retrieval of the net. There were 1,228 sea turtle interactions with 11 being discarded dead and 1,217 discarded alive, with more of these encounters occurring in FOB sets.

The SCRS has used the species composition for target species from the EU purse seine as a proxy for other purse seine fleets. This has not been done for by-catch previously but it seems reasonable to assume that the by-catch species composition may also be very similar between purse seine fleets. Discarding practices and handling practices may, however, differ significantly and so cannot be extrapolated from EU purse seine information.

# 20.8 Advise the Commission on possible measures allowing to reduce discards and to mitigate onboard post-harvest losses and by-catch in ICCAT tropical tuna fisheries. Rec. 16-01, paragraph 53

**Background:** [Rec. 16-01] paragraph 53. The SCRS shall evaluate the contribution of by-catches and discards to the overall catches in ICCAT tropical tuna fisheries, on a fishery by fishery basis and advise the Commission on possible measures allowing to reduce discards and to mitigate onboard post-harvest losses and by-catch in ICCAT tropical tuna fisheries.

One way to reduce discards is to prohibit them. IATTC, IOTC and WCPFC have adopted management measures that prohibit the discarding of bigeye, yellowfin and skipjack in the purse seine fishery, except if the fish are unfit for human consumption or in case of insufficient well space during the last set in a trip. The Commission could consider adopting a similar measure for ICCAT PS fisheries which could improve catch statistics and may also have socio-economic benefits (e.g., for food security). It has been shown that there are local markets with high demand for these discards from tuna purse seiners in the main landing ports in West Africa i.e. Abidjan, Tema and Dakar (Amandè *et al.*, 2016a, Amandè *et al.*, 2016b). Therefore, retaining these discards probably offers more shared benefits from a social and economic point of view than the reverse. Prohibiting discards of other species is also an option, although its implementation may be more difficult due to considerations of well space and species sorting onboard For other fisheries, information such as estimates of total dead and live discards by fleet and gear type, is required to quantify the levels and nature of discarding before clear advice can be provided on discard reduction.

CPCs could also consider other measures, e.g. market incentives, to increase utilization and reduce discards for all tropical tuna fisheries. Utilization already takes place in West Africa. Socio-economic studies of these markets could lead to the identification of mechanisms to enhance them or to implement them in other ports where purse seiners land their catches. Workshops that involve PS skippers have proven to be useful in providing direct feedback on possible discard reductions and incentives for retaining all catches.

Since discards and the catch of certain by-catch species is generally higher in FOB sets, the limitation of FADs fishing effort such as the measures defined in Rec. [16-01] is an indirect way to reduce discards and mitigate by-catch. Studies of the volume of non-tuna species aggregated under FADs suggest that it largely independent of the amount of tuna species present (Dagorn *et al.*, 2012). Thus, avoiding sets with low aggregated biomass will result in relatively higher tuna catches and lower bycatches. However, this may be difficult to regulate in practice. Finally, research is underway to develop acoustic means to discriminate species and sizes of fish aggregated under FADs. Once developed, this technology could be used in echosounder buoys to help fishing masters decide on fishing strategies that reduce unwanted catch.

Various measures to mitigate by-catch of vulnerable species (e.g. elasmobranchs, marine turtles) have been effectively tested and implemented at-sea. These include, the use of non-entangling FADs, release of sharks and turtles from deck, release of sharks from the net before hauling, use of acoustic technology information to help skippers identify the proportion of bigeye and yellowfin tunas compared to skipjack tuna at FADs (Restrepo *et al.*, 2016). The aforementioned methods have proven to be successful in reducing by-catch and/or associated mortality. The Commission should consider some combination of these measures in order to mitigate by-catch. In some cases it is noted that recommendations already exist that include a variety of these measures.

For longline fisheries, the SCRS notes the 2017 recommendation from the Sub-committee on Ecosystems which states that large circle hooks are proven to be effective in reducing sea turtles bycatch and might also increase post-release survival. It is also acknowledged that circle hooks have different impacts on both target and by-catch species. While they decrease marlin by-catch and swordfish catch rates, they increase tropical tuna and sharks catch rates.

Taking into consideration the above scientific information, and that most sea turtle by-catch occurs on shallow longline sets, the Sub-committee recommended the Commission to consider adopting for longline fisheries targeting swordfish and sharks at least one of the following mitigation measures:

- 1. Use of large circle hooks
- 2. Use of finfish bait
- 3. Other measures considered effective by the SCRS

The use of circle hooks have also been advocated and adopted for some billfish species (e.g. Rec. 16-11 for sailfish).

Safe handling of sea turtles on longliners is already advocated in Rec. [13-11]. Recs [11-08], [10-08] and [09-07] for silky, hammerhead and thresher sharks respectively require CPC vessels flying their flag to promptly release these sharks unharmed, either when they come alongside the vessel, or in some cases at the latest before putting the catch into the fish holds, giving due consideration to the safety of crew members. The use of monofilament instead of steel traces or leaders are also known to be effective to reduce shark by-catch in longliner fisheries.

For other fisheries, information such as by-catch rates by species and mitigation studies by fleet and gear type, is required to quantify the levels and nature of by-catch before clear advice can be provided on by-catch mitigation.

# 20.9 Provide information and guidance on enhancing efforts to address any deficiencies identified regarding fisheries for which biological sampling rates that should be increased and fisheries for which improvements in the collection and/or provision of statistical data are necessary to support the stock assessment. SCRS to report efforts made to enhance biological sampling activities. Rec. 16-08, paragraph 20

**Background:** Rec. [16-08] paragraph 20 states that CPCs that harvest Atlantic bluefin tuna should contribute to the research being undertaken through ICCAT's GBYP. Based on analysis at the 2017 Bluefin Tuna Data Preparatory meeting, the SCRS will (a) identify existing Atlantic bluefin tuna fisheries for which biological sampling rates should be increased, (b) identify any such fisheries for which improvements in the collection and/or provision of catch, effort, and/or size data are necessary to support the stock assessment, and (c) provide information and guidance to CPCs and the Commission in 2017 on enhancing efforts to address any deficiencies identified in (a) and (b) above. CPCs should make or continue special efforts to enhance biological sampling activities in Atlantic bluefin tuna fisheries, and SCRS will report to the Commission in 2017 on these efforts. In addition, it is important to continue to explore sampling and/or other approaches for enhancing, and where needed developing, accurate abundance indices for juvenile bluefin tuna. CPCs should also make special efforts to ensure complete and timely submission of any collected data to the SCRS.

The Committee evaluated the available biological samples from the point of view of developing age-length keys and identifying stock of origin. Although a number of tissue samples (muscle, fin spines or otoliths) have been collected in recent years through the GBYP and various other efforts, most of these appear to have been collected opportunistically or according to sampling plans that are not designed to represent all of the major fishing areas over the entire fishing season. There seems to be little coordination among programs and few, if any CPC's have regulations in place that require the fishing industry to make their catch available to samplers. The Committee recommends a sampling plan be developed that includes minimum of 200 bluefin tuna tissue samples per year from each major fleet, to be collected in a representative fashion with respect to season and area fished. The Committee also recommends the formation of an oversight body (perhaps an ad hoc working group) that will coordinate the sampling and processing to ensure that targets are being met and that the resulting data is maintained.

## 20.10 The SCRS shall review new available information related to the identification of specific spawning times and areas of bluefin tuna within the western Atlantic Ocean, and advise the Commission on the results for its consideration. Rec. 16-08, paragraph 23

**Background:** Rec. [16-08] paragraph 23 requests that as part of the 2017 stock assessment, the SCRS shall review new available information related to the identification of specific spawning times and areas of bluefin tuna within the western Atlantic Ocean, including from those CPCs that harvest western Atlantic bluefin tuna, and advise the Commission on the results of this review for its consideration.

The SCRS reviewed the information available for additional spawning areas in the western Atlantic. Data are already available in the literature (Mather *et al.*, 1995), reporting the presence of larvae outside the main spawning area of the Gulf of Mexico between 1959 and 1970, specifically off Carolinas, Maryland and New Jersey (Watson and Matter, 1961), and these findings were linked to the possible presence of a spawning area along the eastern US coast.

During the last 15 years, several electronic tags showed the presence of adult spawners along the western Atlantic coast (in a large area between the northern Florida and Massachusetts, USA) during the spawning seasons but there was no evidence of spawning. More recent evidence was provided by Richardson *et al.* (2016), reporting again several bluefin tuna larvae found along the western Atlantic, in the Slope Sea area (East US coast). According to the authors, these larvae were surely born outside the Gulf of Mexico, possibly in the Slope Sea or in the nearest southern part of the area. For better understanding the possible spawning in this area, the ICCAT GBYP released a contract in 2017 for studying the sexual maturity of the bluefin tuna in this area and the results will be available on February 2018.

According to both Mather *et al.* (1995) and Richardson *et al.* (2016), the bluefin tuna spawning along the eastern US coast are mostly medium-size fish, smaller than those spawning in the Gulf of Mexico. Richardson *et al.* (2016) reported a size range for the spawners in the Slope Sea between 133 and 212 cm FL. Even the spawning season in this area is different, from early June to early August, but the oceanographic conditions are suitable for spawning. The paper by Druon *et al.* (2016) does not include the eastern US coast within the potential spawning areas for bluefin tuna identified by the habitat model; on the opposite, the model identified the Azorean areas as a potential spawning area.

Both the genetic and micro-chemical analyses carried out by the ICCAT GBYP in the last years also revealed that a non-negligible percentage of bluefin tunas in the western area has characteristics different from the WBFT and the EBFT and this might be possibly correlated also to additional spawning areas in the Atlantic Ocean.

#### 20.11 Provide guidance on a range of fish size management measures for western Atlantic bluefin tuna and their impact on yield per recruit and spawner per recruit considerations. To comment on the effect of fish size management measures on their ability to monitor stock status. Rec. 16-08, paragraph 27

**Background:** Rec. [16-08] paragraph 27 requests the SCRS to provide guidance on a range of fish size management measures for western Atlantic bluefin tuna and their impact on yield per recruit and spawner per recruit considerations; and also to comment on the effect of fish size management measures on their ability to monitor stock status.

The Committee reviewed yield-per-recruit calculations in 2012 using various selectivity patterns by gear based on the 2010 assessment results, and for decreased selectivity pattern by up to 40% for ages 1 to 6 for the whole fishery based on the 2012 assessment results. The Committee recognized that Y/R and SSB/R could be improved by changing the selectivity pattern (decreasing the selectivity of ages 1-6 by 40% resulted in only modest improvements), but this would imply allocation changes with implications beyond strict Y/R and SSB/R considerations. In addition, the Committee was concerned that such changes in selectivity would affect the availability and utility of indices of stock sizes currently used in the assessment.

Furthermore, regulations to decrease the catches of ages 1 to 6 bluefin tuna may have unintended negative consequences such as increased discard mortality, which may be difficult to monitor, and changes due to reallocation of effort which may be difficult to predict.

The Committee reiterates last year's request for the Commission to clarify whether it requires further analyses.

#### 20.12 Mauritania will conduct research activities in cooperation with an ICCAT CPC of its choice, and will be subject to the presentation of a specific programme to the SCRS. The result will be made available to the Commission. Rec. 14-04, paragraph 5

**Background:** Rec. [14-04] paragraph 5 states in its footnotes that under this quota Mauritania will conduct research activities that will be reviewed by SCRS by the end of 2017. Such activities will be conducted in cooperation with an ICCAT CPC of its choice and will be subject to the presentation of a specific programme to the SCRS. The result will be made available to the Commission.

The Committee did not receive any report related to research activities conducted by Mauritania, either alone or in collaborations with an ICCAT CPC of its choice, related to bluefin tuna caught under this quota.

### 20.13 Provide the Commission with the confirmed average round weight and gilled and gutted weight, corresponding to the LJFL of 100 cm. Rec. 16-05, paragraph 16

**Background:** Rec. [16-05] paragraph 16. Request prior to the 2017 Annual meeting, SCRS shall provide the Commission with the confirmed average round weight and gilled and gutted weight, corresponding to the LJFL of 100cm.

The Table below indicates mean weight estimates corresponding to 100cm LJFL, based on large integrated data sets from various Mediterranean areas. Estimates are based on SCRS/2017/209 document and the relevant equations provided below. As there are important spatial and temporal variations, the 95% confidence intervals of the corresponding estimates are also included (in parenthesis).

Weight type	Estimate (kg)
Gilled-Gutted (GG)	11.06 (9.86-12.37)
Gutted (GW)	11.68 (10.44-13.03)
Round (RW)	12.61 (11.24-14.10)

Length-weight relationships:

GG = 0.00000843 x LJFL^3.059

GW = 0.00000645 x LJFL^3.129

 $RW = 1.14 \times GG$ 

Where, LJFL is the Lower-jaw fork length (cm); GG is the gilled and gutted weight; GW is the gutted weight; and RW is the round weight.

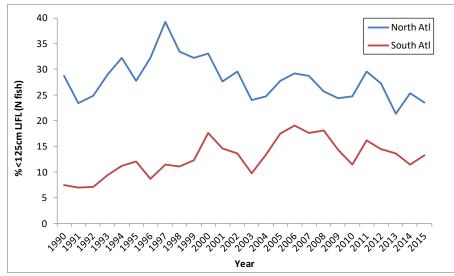

## 20.14 Continue to monitor and analyze the effects of the minimum size measure on the mortality of immature swordfish. Recs. 16-03, paragraph 10 and 16-04, paragraph 7

**Background:** Rec. [16-03] paragraph 10 and Rec. [16-04] paragraph 7. The SCRS should continue to monitor and analyze the effects of this measure on the mortality of immature swordfish.

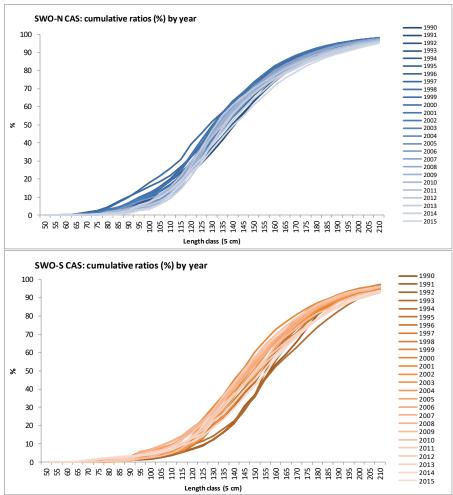

There are two minimum size options that are applied to the entire Atlantic: 125 cm LJFL with a 15% tolerance, or 119 cm LJFL with zero tolerance and evaluation of the discards.

Since the implementation of the minimum landing sizes in 2000, the estimate of percentage of swordfish less than 125 cm LJFL reported landed (in number) has been generally decreasing in the North Atlantic and stable in the South. In the North Atlantic, the estimate was 33% in 2000 and decreased to 23% in 2015. In the South Atlantic the estimate was 18% in 2000 and decreased to 13% in 2015 (**Figure 1**). Starting in 1990, the cumulative percentage of the size classes has shown a shift to larger size classes in the North Atlantic, but to slightly smaller sizes in the South (**Figure 2**). The Committee notes that these estimations are highly unreliable and will be biased unless CPCs fully report size samples from the entire catch.

The Committee recently reviewed several studies on swordfish hooking mortality that have showed that the values are very high, in particular for small swordfish. Specifically, for some surface longline gears, the estimates of hooking mortality for specimens <125 cm LJFL ranged between 78-88%, with the post-release mortality of specimens discarded alive unknown. The low survival of discarded swordfish opens the question as to whether the minimum retention sizes currently in place are effective in protecting juvenile swordfish. However, the Committee also noted that minimum size regulations imposed by some CPCs has led to avoidance of areas of high concentration of small swordfish. Implementing other strategies to protect juvenile swordfish such as time/area closures of juvenile hotspots or gear modifications will need completeness of datasets on fishing effort and size data over the entire Atlantic, and should take into account the effects on other species. In view of the Commission objective to protect small swordfish, the Committee therefore recommended that future work should be carried out to determine more precisely the effort, size and sex distribution of undersized swordfish in the Atlantic, using high resolution observer data.

**Figure 1.** Trends of the % of the swordfish catch (in number of fish) estimated to be smaller than 125 cm LJFL, between 1990 and 2015 for the North and South Atlantic swordfish stocks. Data from the swordfish catch-at-size estimations.

**Figure 2.** Cumulative % of fish (in number) per size class (5 cm LJFL) estimated for the North and South Atlantic swordfish, between 2000 and 2015. Data from the swordfish catch-at-size estimations.

## 20.15 Develop a new data collection initiative as part of the ICCAT Enhanced Program for Billfish Research to overcome the data gap issues. Rec. 15-05, paragraph 10 and Rec. 16-11, paragraph 3

**Background:** Rec. [15-05] paragraph 10. Request the SRCS to review the data on dead and live discards submitted by CPCs to determine the feasibility of estimating fishing mortality by commercial fisheries, recreational, and artisanal fisheries.

A preliminary revision of Task I Discards (DD:dead; DL:alive) of the major billfish species provided by the Secretariat showed that since 2006, only two CPCs (Mexico and U.S.A.) have consistently reported dead and live discards for all major billfish species throughout the time period revised (2006-2015). The rest of the seven CPCs that report DD and DL, do not have discard information for the complete time period reviewed. The review conducted does not allow the Committee to determine the feasibility of estimating fishing mortality by commercial, recreational, and artisanal fisheries. If more complete data on discards is provided before the 2018 Data preparatory meeting, the upcoming 2018 blue marlin assessment may provide a better insight in the estimation of fishing mortality by gear from discards.

**Background:** Rec. [15-05] end of paragraph 10, and Rec. [16-11] paragraph 3. Request the SCRS to develop a new data collection initiative as part of the ICCAT Enhanced Program for Billfish Research to overcome gaps in fisheries catching billfish, particularly in artisanal fisheries.

In order to devise a new data collection initiative as part of the ICCAT Enhanced Program for Billfish Research to overcome data gaps in fisheries catching billfish (directed or as by-catch), particularly in artisanal fisheries, a comprehensive study of strategic investments related to artisanal fisheries data collection in ICCAT Fisheries is required. The requirement was partially fulfilled with an inventory of artisanal fisheries in the West Africa Region, but is not complete due to the absence of a similar study for the Latin America/Caribbean Region, despite the reiterative requests made by the Committee to commit funds to complete such study in the Latin America/Caribbean Region.

As it was stated recently by the Committee, in its response to the Commission on the evaluation of data deficiencies, the Committee noted the potential existence of non-reported billfish catches from the Latin America/Caribbean Region, likely due to the development of moored FAD fisheries in some Caribbean countries over the past decades, and the non-reported catches in recent years from countries that previously reported billfish catch data to ICCAT. This situation puts the Committee in a position in which it cannot determine if these data deficiencies are related to declines in effort or to lack of reporting. In order to overcome this uncertainty, a comprehensive study of strategic investments related to artisanal fisheries data collection in the Latin America/Caribbean Region is warranted urgently. The terms of reference are detailed in the 2018 Billfish Work Plan.

A comprehensive study of strategic investments related to artisanal fisheries data collection in ICCAT Fisheries in the Caribbean Region is a necessary next step to respond to the Commission's desire to overcome data gaps in fisheries catching billfish, particularly those from artisanal fisheries, and improve future stock assessments and the quality of management advice to be provided. The proposed study is also consistent with the SCRS Strategic plan for 2015-2020.

# 20.16 Refine the testing of candidate reference points (e.g. $SSB_{THRESHOLD}$ , $SSB_{LIM}$ and $F_{TARGET}$ ) and associated harvest control rules (HCRs) that would support the management objective expressed in paragraph 2 of Rec. 16-06. The SCRS shall also provide statistics to support decision-making in accordance with the performance indicators in Annex 2. Rec. 16-06, paragraph 11

**Background:** Recommendation [16-06] paragraph 12 requires the SCRS in 2017 to refine the testing of candidate reference points (e.g., SSB<sub>THRESHOLD</sub>, SSB<sub>LIM</sub> and F<sub>TARGET</sub>) and associated harvest control rules (HCRs) that would support the management objective expressed in paragraph 2 above. The SCRS shall also provide statistics to support decision-making in accordance with the performance indicators in Annex 2.

The results of the HCRs evaluated under the MSE framework are included in the albacore Executive Summary. Additional information about the MSE can be found in the detailed report of the 2017 albacore species group intersessional meeting. All eight HCRs meet the objective to be in the green quadrant of the Kobe Plot with > 60% probability, and the results are presented in a simple manner to allow the Commission to consider the main tradeoffs between HCRs.

In the Executive Summary, a single performance statistic is chosen for each of the main objectives (namely stock status, safety, stability and catch). Additional performance statistics (as in Annex 2 of Rec. [16-06]) are shown in the **Table** below. For instance, the probability to be between SSB<sub>lim</sub> and SSB<sub>thr</sub> has been selected for the plots in the Executive Summary since this indicator showed more contrast between HCRs than e.g. the probability to be below SSB<sub>lim</sub>, which is very low in all cases. Likewise, some performance statistics related to safety (namely the probability to shut down or the maximum % change in TAC) showed clear contrast between HCRs with and without bounds in the 20% δTAC.

The Committee noted that the performance statistics reflected in table 20.16 are medians of the performance statistics across all the 132 OMs. As such, they allow to compare the relative performance of such HCRs under the OMs considered. However, it should be clarified that they do not necessarily reflect the conditions that will prevail if any of the HCRs is adopted. In the future, the Committee could produce additional performance statistics upon request by the Commission (e.g. the percent of OMs that meet the objective under each HCR).

**Table 20.16.** Performance of eight HCRs, according to the performance statistics defined by Rec. 16-06 Annex 2. The combination of the target fishing mortality ( $F_{TAR}$ ), Biomass threshold ( $B_{THRESH}$ ) and the type of stability clause defines the HCR. Two stability clauses were considered: (SC1) maximum change in TAC of 20% always applied from one 3-year management period to the next while also always imposing a 15,000-50,000 t min-max TAC; and, (SC2) same as SC1 but not restricting TAC reductions and not imposing a minimum TAC when B<B<sub>THR</sub>. Each HCR has a unique identification number in this table and in Figure 12 of the Atlantic Albacore Executive Summary.

		HCR		Stock Status	Safety	Catch	Stability
Number	Ftar	Bthresh	Stability clause	pGr%	pBint%	LongY (kt)	MAP (%)
1	0,80	0,80	SC2	85,5	9,0	26,5	8,3
2	1,00	0,80	SC2	78,9	13,0	29,0	8,8
3	0,80	1,00	SC2	88,6	8,3	26,9	8,3
4	1,00	1,00	SC2	84,5	9,2	26,9	8,9
1	0,80	0,80	SC1	85,8	9,3	32,1	5,6
2	1,00	0,80	SC1	74,7	15,8	34,1	6,2
3	0,80	1,00	SC1	86,0	10,4	32,2	6,0
4	1,00	1,00	SC1	77,9	14,3	35,0	6,3

Finally, the SWGSM acknowledged that "ICCAT would need to define what it considers "exceptional circumstances" that would result in suspending the application of the HCR, and also establish guidance on the alternative management response in those circumstances." Moreover, it was suggested that SCRS could provide some advice on the technical aspects of this issue for the Commission's consideration. In other t-RFMOs, exceptional circumstances refer to a wide range of situations, including stock trajectories out of the ranges tested within the MSE framework, extreme environmental regimes, inability to update the stock status and thus to apply the HCR to determine a new TAC, or a biomass estimate below a predefined SSB<sub>lim</sub>. In the case of North Atlantic albacore, these cases could be considered exceptional circumstances and the Commission would need to decide what to do if such situations are faced. The SCRS could try to incorporate these circumstances in future developments of the MSE framework in order to provide further advice to the Commission.

## 20.17 The HCRs referred to in paragraph 15 of Rec. 16-06 should be evaluated by the SCRS through the management strategy evaluation process, including in light of new assessments of the stock. Rec. 16-06, paragraph 14

**Background:** Recommendation [16-06] paragraph 15 states that the HCRs referred to in paragraph 14 should be evaluated by SCRS through the management strategy evaluation process, including in light of new assessments of the stock.

The results of the HCRs evaluated under the MSE framework are included in the Albacore Executive Summary (see also response to Commission 20.16 above). The MSE used is specifically tailored to evaluate a series of model-based HCRs as a component of a Management Procedure that mimics the 2016 stock assessment of North Atlantic albacore. Thus, should the Commission select a specific HCR, this would be applied to the results of the last assessment to set a constant annual TAC from 2018 to 2020. In future, stock status could be assessed using alternative methods, but in order to use these alternative methods as components of MPs to manage the stocks, the new MPs would need to be tested within the MSE framework.

20.18 Provide with a summary of the scientific data and information collected and reported pursuant to Rec. 16-14 and any relevant associated findings. Recommend on how to improve the effectiveness of scientific observer programs, including possible revisions to Rec. 16-14 and/or with respect to implementation of these minimum standards and protocols by CPCs. Rec. 16-14, paragraph 12 c and d

Background: Recommendation requires the SCRS to:

- (a) develop, as needed and appropriate, an observer working manual for voluntary use by CPCs in their domestic observer programmes, that includes model data collection forms and standardized data collection procedures, taking into account observer manuals and related materials that may already exist through other sources, including CPCs, regional and sub-regional bodies, and other organizations;
- (b) develop fisheries specific guidelines for electronic monitoring systems;
- (c) provide the Commission with a summary of the scientific data and information collected and reported pursuant to this recommendation and any relevant associated findings.

The Sub-committee discussed that some of the information required by Rec. 16-14, paragraph 12, already exists and needs to be compiled. There was a general agreement that a complete response to this recommendation will require coordination among several SCRS Working Groups. It was also agreed that the SCRS Chair, the Chair of the Sub-committee on Ecosystems, and other SCRS Chairs will draft a response to the Commission to be reviewed during the 2018 SCRS Plenary meeting.

# 20.19 Review Rec. 14-09 and consider revisions to improve its effectiveness. To inform this review, the SCRS is requested to provide advice on the VMS data that would most assist the SCRS in carrying out its work, including frequency of transmission for the different ICCAT fisheries. Rec. 14-09, paragraph 7

**Background:** Recommendation [14-09] paragraph 7 requires that to review the use of Vessel Monitoring System (VMS), the SCRS is requested to provide advice on the VMS data that would most assist the SCRS in carrying out is work, including frequency of transmission for the different ICCAT fisheries.

The Committee reiterated the utility of VMS data for assessing fishing activity in the Atlantic Ocean. It was noted that the ICCAT FAD Working Group had also stressed the need to access VMS data in order to better characterize fishing effort of purse seiners and therefore improve the corresponding CPUE indices. The Subcommittee noted that scientists should have access to this data to improve their analyses. While acknowledging that the higher the frequency of reporting the more useful the VMS data is, the Committee still has to complete a full analysis of the optimum frequency of VMS transmission for different ICCAT fisheries. Nevertheless, the 4-hour frequency of transmission in Rec. [14-09] is insufficient to detect fishing activity for many gear types.

## 20.20 Confirmation by the Shark Species Group regarding exemption of the necessity for data submission by CPCs. Rec. 16-13, paragraph 2

**Background:** In [Rec. 16-13] paragraph 2, regarding submission of data by CPCs on the implementation of shark conservation measures, the Commission requests that: "CPCs may be exempt from the submission of the check sheet when vessels flying their flag are not likely to catch any sharks species covered by the abovementioned Recommendations in paragraph 1, on the condition that the concerned CPCs obtained a confirmation by the Shark Species Group through necessary data submitted by CPCs for this purpose.

The Sharks Working Group noted that two CPCs had submitted requests for exemption of the requirement to submit information to the Commission regarding the implementation of shark conservation measures (pursuing to Rec. [16-13]). These were provided to the Group for comments. At the Data Preparatory meeting held in March 2017, the Group discussed a list of criteria to review these exemption requests. These criteria are provided below but have not yet been adopted by either the SCRS or the Commission. The Group did not feel they had a clear method to review the exemptions requests received. As such, the Group recommends that no exemptions be granted prior to the adoption of the evaluation criteria recommended by the Group.

The Group recommends that CPCs requesting an exemption of the requirement to submit information to the Commission regarding the implementation of shark conservation measures (pursuing Rec. [16-13]), should submit the following information to the Group so that it can make a determination that the exemption is justified:

- List of species of sharks recorded to be present in the area of tuna fishing activities of the CPC
- Evidence (e.g. scientific surveys, scientific observer data, landing surveys) that clearly indicate the lack of interactions between CPCs tuna fleets and shark species considered by ICCAT conservation measures
- Information on the spatial extent of fishing effort by CPC tuna fleets
- A plan for periodic review of the scientific information that justifies the exemption request

This information has to be provided to the ICCAT Secretariat at least two weeks prior to the meeting of the Group in September. The Group will then make a recommendation on whether the request for exemption is justified and will transmit this recommendation to the Plenary of the SCRS for review.

### 20.21 Develop rules of procedure, including a code of conduct for scientists and observers. Rec. 13-12, paragraph 1

**Background:** Recommendation [13-12] paragraph 1 states that pursuant to paragraph 2(ii) of Resolution 11-17, SCRS shall develop rules of procedure, including a code of conduct for scientist and observers, in the framework of its Strategic Plan, and submit this to the 2015 Commission Annual meeting for endorsement.

This recommendation requested the SCRS to develop rules of procedure, including a code of conduct for scientist and observers, in the framework of its Strategic Plan.

The Strategic Plan established the values that should be guiding the conduct for scientists and observers that participate in the work of the SCRS:

"INTEGRITY: The SCRS applies the highest ethical standards to all its scientific work.

INDEPENDENCE: The SCRS provides advice that is objective and based on the best scientific information available and not unduly influenced by stakeholders, ideological or political pressure groups or by economic or financial interests.

COOPERATION: The SCRS values and encourages the participation of scientists from all CPCs, acting through scientific collaboration and cooperation to c.ultivate a diverse set of expertise and to promote best available scientific practices.

COMMITMENT: We are totally committed to provide the best scientific advice in support of the Commission's objective of implementing science-based fishery management.

ABILITY: The SCRS strives to ensure the work of the Committee conforms to the highest scientific standards and state of the art methodologies, constantly improving the foundation of knowledge to support the mandate.

TRANSPARENCY: The SCRS conducts its work in open sessions and encourages the participation of National scientists and external experts; the information, analyses and decision-making process are well documented and easily accessible to all interested Parties."

Every scientist should make sure these values are always reflected in the work they conduct as part of the SCRS.

The SCRS also has some practices that define the rules and procedures that facilitate the participation at SCRS meetings. These include:

• the guidelines for observer status [Rec 05-12], which establish how scientists that are not associated with a CPC delegation can attend and participate in the SCRS meetings;

• the *Protocols to Follow for the Use of Data Funds & Other ICCAT Funds*<sup>1</sup>, which contain the procedures to help developing ICCAT Contracting Parties to obtain assistance to attend SCRS meetings.

There are also procedures on how data managed by the ICCAT Secretariat can be accessed by scientists: *Rules and procedures for the protection, access to, and dissemination of data compiled by ICCAT*<sup>2</sup>, which include general principles, specific definitions of confidentiality provisions and non-public domain data and corresponding templates for data requests and confidentiality agreements.

Whilst having to ensure transparency the SCRS needs to make sure of the integrity of the information that it provides. Therefore, all intersessional meeting reports will contain the following text:

"The results, conclusions and recommendations contained in this Report only reflect the view of the Species/Working Group/Sub-Committee. Therefore, these should be considered preliminary until the SCRS adopts them at its annual Plenary meeting and the Commission revise them at its Annual meeting.

Accordingly, ICCAT reserves the right to comment, object and endorse this Report, until it is finally adopted by the Commission."

#### 20.22 Conversion algorithm for the caging operations. Rec. [14-04] Annex 9, item iii

**Background:** In 2016 the SCRS provided to the Commission a response to their request regarding algorithms for the purposes of bluefin tuna caging operations (Response to the Commission 18.13 of the SCRS 2016 Report). During the discussions of this response that took place during the 2016 Commission meeting, it was noted that the algorithm proposed by the SCRS,

$$RWT = 2.8684 E-5 * SFL ^ 2.9076$$
 (1)

may not be appropriate for caging operations in the Adriatic. The Commission agreed to use the alternative algorithm for the Adriatic until additional guidance on a more appropriate algorithm was provided by the SCRS,

where, RWT is the specimen round weight (in kg) and SFL is the specimen straight fork length (in cm).

During 2017 Croatian scientists collected additional information on lengths and weights of fish caged in the Adriatic Sea and presented to the SCRS a document (Kataviç *et al.*, 2017) confirming that equation (2) is more appropriate for the Adriatic than equation (1). Therefore, the Committee recommends equation (2) to be used to convert SFL in to RWT during caging operations in the Adriatic Sea.

#### 21. Other matters

#### 21.1 Collaboration with other International Organizations (ICES, CITES, GEF, etc.)

#### **Collaboration with ISSF**

The International Seafood Sustainability Foundation (ISSF) continues providing the Secretariat with detail catch (by vessel trip, species and commercial size category) for all purchases made ISSF-participating companies. These correspond to unloading of Atlantic catches from tropical tunas (bigeye, yellowfin, and skipjack) and albacore to canning plants around the world. This information has previously been used by the SCRS scientists to complement and improve the Ghanaian Task II statistics. It has been noted that the submissions have been made in a diverse range of formats. As such, ISSF agreed in 2015, to look into standardising the data submissions. As such, the data received are still being stored by ICCAT, but have not been made available for use to the SCRS at this stage.

#### TES

In 2017 ICCAT representatives from ICCAT (SCRS Chair and Sharks Species Group Chair) attended a meeting entitled "The Cooperation on implementing CITES for marine species: achievements, lessons learned and future opportunities" that was held in Geneva, Switzerland from the 13-15 March 2017. This continued the beneficial cooperation established between ICCAT and CITES in recent years.

The Secretariat also acknowledged that a recommendation had been made by the Sharks Working Group for the ICCAT Secretariat to make an official request to CITES to facilitate the sampling of CITES listed species for the purposes of scientific research conducted under the auspices of ICCAT research programmes. The Secretariat agreed that it would establish contact with the CITES secretariat to seek a solution to this concern and report back to the sharks working group in 2018.

#### ICES

Considering the fruitful experience ICCAT and ICES have had in recent years with regard to scientific collaboration, there is the willingness of both organisations to strengthen this cooperation and explore new initiatives and discussions have commenced between the Secretariats. In 2017 was agreed that it is appropriate and desirable to improve collaboration between ICCAT SCRS-ICES, particularly in the areas of by-catch and sharks issues, through our Sub-committee on Ecosystems and by-catch and the Shark species group. Specifically, it would be convenient to keep the participation of ICES scientific experts in ICCAT shark stock assessments and vice versa. It is envisioned that following the joint ICCAT/ICES training courses that have been held in the past, ICCAT could continue to work with ICES on areas of capacity building.

#### **GEF-** Common Oceans/ABNJ Tuna Project

At the 2015 ICCAT Commission meeting, it was decided to continue to cooperate with this programme provided that there are benefits to ICCAT. To this end, since the previous SCRS plenary, the ICCAT Secretariat has participated in several ABNJ Common Oceans initiatives. These include participation in the following meetings that were funded or partially funded by the project:

- 1. Joint tuna RFMO MSE meeting held at the Secretariat office, Madrid (1-3 November 2016);
- 2. Joint Meeting of tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management, which took place in FAO HQ in Rome, Italy (12-14 December 2016);
- 3. 1st Regional Seabird By-catch Pre-assessment Workshop held at the Kruger Park, South Africa (23 February 1 March 2017);
- 4. Tuna compliance network meeting held in Vigo, Spain (27-31 March 2017);
- 5. 1st Joint T-RFMO FAD Working Group Meeting, held in Madrid Spain (19-21 April 2017).

In addition, ICCAT has been coordinating a feasibility study on the development of an online reporting system. This includes both a feasibility study to determine the resources, costs, technologies required to implement an online reporting system, as well as the production of a demo online reporting tool. Due to the requirements of the ABNJ project, this study and demo are generic and could potentially be applied across the tuna RFMOS.

ICCAT also made several proposals to the FAO Common Ocean/ABNJ Tuna Project steering committee for future collaborations. So far, ICCATs attempts to increase collaboration with the project have not been completely successful. Final decisions on funding the proposals made (listed below) are still pending:

- 1. Proposal for a 2nd Joint t-RFMO FAD Working Group Meeting;
- 2. Proposed meeting of the t-RFMO MSE Working Group (and associated activities);
- 3. Lead and coordinate an Ecosystem Component: Common oceans ABNJ tuna project, including a follow up meeting to that held in December 2016;
- 4. Support for ICCAT Port Inspection Expert Group for Capacity Building and Assistance.

Further information regarding ICCATs involvement in the FAO Common Oceans/ABNJ Tuna Project are provided in **Appendix 14.** 

The Committee noted the concerns the Secretariat had expressed regarding their involvement in the GEF-Common Oceans ABNJ Tuna Project but expressed a desire that involvement in the project should be continued where possible. It was noted that particularly with regards to advancing the MSE and EBFM processes, productive collaboration and cooperation in these areas could be used to maintain ICCAT involvement in the project.

Clarification was requested on how the issues with the GEF- Common Oceans ABNJ Tuna Project arose and why ICCAT has been struggling to be involved in the project when other RFMOs seem to be benefiting from their funding. It was clarified that when the original project activities were finalized, ICCAT had been largely excluded despite being part of the planning process. These issues have been clearly documented in past SCRS and Commission meeting reports.

#### 21.2 Consideration of implications of the Fifth Meeting of the Working Group on Convention Amendment and of the Meeting of the Ad Hoc Working Group to Follow up on the Second Performance Review

#### **Convention Amendment**

The Working Group on Convention Amendment held its fourth meeting in June 2017. Most of the pending issues have been discussed and proposals have been put forward. The issue of changing the Depositary from FAO to EU did not received the agreement of all CPC's. However, discussions between CPCs are occurring and a Chair's text proposal for amendment of the International Convention for the Conservation of Atlantic Tunas will be presented at the Commission meeting in November 2017.

#### Performance review

The Ad Hoc Working Group to Follow-up on the Second Performance Review was held in June 2017. A number of tasks were agreed to be carried out by the various subsidiary bodies of the Commission based on the issues identified in the Second independent ICCAT Performance Review.

#### 21.3 Update of the ICCAT glossary

The Chair informed the Committee that the Ad hoc Working Group on FADs is working on several definitions related to FAD fishing. Additionally, t-RFMO technical Working Group on MSE is also working on definitions related to the MSE process.

### 21.4 Consideration of new publication guidelines: Executive summaries, Detailed reports and SCRS Report

Due to the lack of time during the Plenary session it was decided to postpone the discussions on this item to 2018.

#### 21.5 Peer review publication (SCRS documents): agreement with Aquatic Living Resources journal

Due to the lack of time during the Plenary session it was decided to postpone the discussions on this item to 2018.

#### 22. Adoption of report and closure

The Chair thanked the SCRS for its hard work this year.

Dr. Die thanked the Secretariat staff for their excellent work, as well as appreciating their professional attitude. Dr. Die then expressed his appreciation towards the interpreters.

On behalf of the Executive Secretary, the Assistant Executive Secretary showed his appreciation towards Dr. Die for the work carried out during his third Plenary meeting as SCRS Chair. Dr. Neves dos Santos also thanked Dr. Die for the trust he placed in the Secretariat and expressed his appreciation towards the Secretariat staff for their efforts in supporting the SCRS work throughout the year and during the meeting. Finally, Dr. Neves dos Santos thanked the interpreters for their hard work during the week and wished everyone a safe journey home.

The Report of the 2017 SCRS meeting was adopted and the 2017 Meeting of the SCRS was adjourned.

#### Appendix 1

#### Agenda

- 1. Opening of the meeting
- 2. Adoption of Agenda and arrangements for the meeting
- 3. Introduction of Contracting Party delegations
- 4. Introduction and admission of observers
- 5. Admission of scientific documents
- 6. Report of Secretariat activities in research and statistics
- 7. Review of national fisheries and research programs
- 8. Executive Summaries on species:

YFT-Yellowfin, BET-Bigeye, SKJ-Skipjack, ALB-Albacore, BFT-Bluefin, BUM-Blue marlin, WHM-White marlin, SAI-Sailfish, SWO-Atl. Swordfish, SWO-Med. Swordfish, SMT-Small tunas, SHK-Sharks

- 9. Report of inter-sessional SCRS meetings
  - 9.1 Meeting of the ICCAT Working Group on Stock Assessment Methods
  - 9.2 Small tuna Species Group intersessional meeting
  - 9.3 Tropical Tuna Species Group intersessional meeting
  - 9.4 Albacore Species Group intersessional meeting (including stock assessment of Mediterranean albacore)
  - 9.5 Shortfin mako shark data preparatory and assessment meetings
  - 9.6 Atlantic swordfish data preparatory and assessment meetings
  - 9.7 Bluefin data preparatory and stock assessment meetings
- 10. Report of Special Data Collection and Research Programs
  - 10.1 Atlantic-Wide Research Programme for Bluefin Tuna (ICCAT GBYP)
  - 10.2 Enhanced Billfish Research Programme (EBRP)
  - 10.3 Small Tunas Year Programme (SMTYP)
  - 10.4 Shark Research and Data Collection Programme (SRDCP)
  - 10.5 Atlantic Ocean Tropical tuna Tagging Programme (AOTTP)
- 11. Report of the Sub-committee on Statistics
- 12. Report of the Sub-committee on Ecosystems and By-catch
- 13. Considerations of implications of the Meeting of the Joint t-RFMO FAD Working Group
- 14. Report of the Ad Hoc Working Group on FADs
- 15. Considerations of implications of the Meeting of the Standing Working Group on Dialogue between Fisheries Scientists and Managers
- 16. Progress related to work developed on MSE
  - 16.1 t-RFMO MSE Working Group
  - 16.2. Work conducted under ICCAT GBYP
  - 16.3. Work conducted for other species
- 17. Report on the implementation of the Science Strategic Plan for 2015-2020 in 2017 and work plan for 2018, which includes the update of the stock assessment software catalogue

- 18. Consideration of plans for future activities
  - 18.1 Annual Work Plans
  - 18.2 Inter-sessional meetings proposed for 2018
  - 18.3 Date and place of the next meeting of the SCRS
- 19. General recommendations to the Commission
  - 19.1 General recommendations to the Commission that have financial implications
  - 19.2 Other recommendations
- 20. Responses to Commission's requests\*\*\*
  - 20.1 Ghana's comprehensive and detailed capacity management plan on the level of catches. Rec. 16-01, paragraph 12c
  - 20.2 Evaluate the efficacy of the area/time closure referred to in paragraph 13 in relation with the protection of juveniles of tropical tunas. Rec. 16-01, paragraph 15
  - 20.3 Review its 2016 recommendations on observer coverage and advise the Commission on appropriate coverage levels. Rec. 16-01, paragraph 42
  - 20.4 Recommendations made by the FAD Working Group (Annex 8) and develop a work plan. Rec. 16-01, paragraph 49 (a)
  - 20.5 Provide performance indicators for skipjack, bigeye and yellowfin tuna, with the perspective to develop management strategy evaluations for tropical tunas. Rec. 16-01, paragraph 49 (b)
  - 20.6 Develop a table that quantifies the expected impact on MSY, B<sub>MSY</sub>, and relative stock status for both bigeye and yellowfin resulting from reductions of the individual proportional contributions of major fisheries to the total catch. Rec. 16-01, paragraph 49 (c)
  - 20.7 Evaluate the contribution of by-catches and discards to the overall catches in ICCAT tropical tuna fisheries, on a fishery by fishery basis. Rec. 16-01, paragraph 53
  - 20.8 Advise the Commission on possible measures allowing to reduce discards and to mitigate onboard post-harvest losses and by-catch in ICCAT tropical tuna fisheries. Rec. 16-01, paragraph 53
  - 20.9 Provide information and guidance on enhancing efforts to address any deficiencies identified regarding fisheries for which biological sampling rates that should be increased and fisheries for which improvements in the collection and/or provision of statistical data are necessary to support the stock assessment. SCRS to report efforts made to enhance biological sampling activities. Rec. 16-08, paragraph 20
  - 20.10 The SCRS shall review new available information related to the identification of specific spawning times and areas of bluefin tuna within the western Atlantic Ocean, and advise the Commission on the results for its consideration. Rec. 16-08, paragraph 23
  - 20.11 Provide guidance on a range of fish size management measures for western Atlantic bluefin tuna and their impact on yield per recruit and spawner per recruit considerations. To comment on the effect of fish size management measures on their ability to monitor stock status. Rec. 16-08, paragraph 27
  - 20.12 Mauritania will conduct research activities in cooperation with an ICCAT CPC of its choice, and will be subject to the presentation of a specific programme to the SCRS. The result will be made available to the Commission. Rec. 14-04, paragraph 5
  - 20.13 Provide the Commission with the confirmed average round weight and gilled and gutted weight, corresponding to the LJFL of 100 cm. Rec. 16-05, paragraph 16
  - 20.14 Continue to monitor and analyze the effects of the minimum size measure on the mortality of immature swordfish. Recs. 16-03, paragraph 10 and 16-04, paragraph 7
  - 20.15 Develop a new data collection initiative as part of the ICCAT Enhanced Program for Billfish Research to overcome the data gap issues. Rec. 15-05, paragraph 10 and Rec. 16-11, paragraph 3

- 20.16 Refine the testing of candidate reference points (e.g. SSB<sub>THRESHOLD</sub>, SSB<sub>LIM</sub> and F<sub>TARGET</sub>) and associated harvest control rules (HCRs) that would support the management objective expressed in paragraph 2 of Rec. 16-06. The SCRS shall also provide statistics to support decision-making in accordance with the performance indicators in Annex 2. Rec. 16-06, paragraph 11
- 20.17 The HCRs referred to in paragraph 13 of Rec. 16-06 should be evaluated by the SCRS through the management strategy evaluation process, including in light of new assessments of the stock. Rec. 16-06, paragraph 14
- 20.18 Provide with a summary of the scientific data and information collected and reported pursuant to Rec. 16-14 and any relevant associated findings. Recommend on how to improve the effectiveness of scientific observer programs, including possible revisions to Rec. 16-14 and/or with respect to implementation of these minimum standards and protocols by CPCs. Rec. 16-14, paragraph 12 c and d
- 20.19 Review Rec. 14-09 and consider revisions to improve its effectiveness. To inform this review, the SCRS is requested to provide advice on the VMS data that would most assist the SCRS in carrying out its work, including frequency of transmission for the different ICCAT fisheries. Rec. 14-09, paragraph 7
- 20.20 Confirmation by the Shark Species Group regarding exemption of the necessity for data submission by CPCs. Rec. 16-13, paragraph 2
- 20.21 Develop rules of procedure, including a code of conduct for scientists and observers. Rec. 13-12, paragraph 1
- 20.22 Conversion algorithm for the caging operations. Rec. [14-04] Annex 9, item iii

#### 21. Other matters

Chief, Sustainable Fisheries Division, Southeast Fisheries Science Center, National Marine Fisheries Service, 75 Virginia Beach Drive, Miami Florida 33149 Tel: +1 305 361 4232, Fax: +1 305 361 4219, E-Mail: clay.porch@noaa.gov

#### Schirripa, Michael \*

NOAA Fisheries, Southeast Fisheries Science Center, 75 Virginia Beach Drive, Miami Florida 33149 Tel: +1 305 361 4568, Fax: +1 305 361 4562, E-Mail: michael.schirripa@noaa.gov

#### Walter, John

NOAA Fisheries, Southeast Fisheries Center, Sustainable Fisheries Division, 75 Virginia Beach Drive, Miami Florida 33149

Tel: +305 365 4114, Fax: +1 305 361 4562, E-Mail: john.f.walter@noaa.gov

#### URUGUAY

**Domingo,** Andrés Dirección Nacional de Recursos Acuáticos - DINARA, Laboratorio de Recursos Pelágicos, Constituyente 1497, 11200 Montevideo Tel: +5982 400 46 89, Fax: +5982 401 32 16, E-Mail: adomingo@dinara.gub.uy;dimanchester@gmail.com

#### VENEZUELA

**Arocha**, Freddy \* Instituto Oceanográfico de Venezuela, Universidad de Oriente, A.P. 204, 6101 Cumaná Estado Sucre Tel: +58-293-400-2111 - móvil: 58 416 693 0389, E-Mail: farocha@udo.edu.ve; farochap@gmail.com

#### **OBSERVERS FROM COOPERATING NON-CONTRACTING PARTIES, ENTITIES, FISHING ENTITIES**

#### **CHINESE TAIPEI**

**Chang,** Feng-Chen Overseas Fisheries Development Council, 3F., No14, Wenzhou St. Da'an Dist. 106 Tel: +886 2 2368 0889 ext. 126, Fax: +886 2 2368 1530, E-Mail: fengchen@ofdc.org.tw; d93241008@ntu.edu.tw

#### Huang, Julia Hsiang-Wen

Director and Professor, Institute of Marine Affaires and Resource Management, National Taiwan Ocean University, No. 2 Pei-Ning Road, 202 Keelung City Tel: +886 2 2462 2192 Ext. 5608, Fax: +886 2 2463 3986, E-Mail: julia@ntou.edu.tw

#### Lu, Ching-Ping

Overseas Fisheries Development Council, 3F., No. 14, Wenzhou St., Da'an Dist., 106 Tel: +886 2 2368 0889 ext. 138, Fax: +886 2 2368 3536, E-Mail: michellecplu@ofdc.org.tw; michelllecplu@gmail.com

#### Su, Nan-Jay

Assistant Professor, Department of Environmental Biology and Fisheries Science, No. 2 Pei-Ning Rd. Keelung, 202 Tel: +886 2 2462-2192 #5046, E-Mail: nanjay@ntou.edu.tw

#### **OBSERVERS FROM INTERGOVERNMENTAL ORGANIZATIONS**

#### FOOD AND AGRICULTURE ORGANIZATION - FAO

**Gutiérrez de los Santos,** Nicolás Luis Fisheries Resources Officer, Fisheries and Aquaculture Resources, Use and Conservation Division. FAO, Viale delle Terme di Caracalla, 00153 Rome, Italy

Tel: +39 06 570 56563, E-Mail: nicolas.gutierrez@fao.org

#### **OBSERVERS FROM NON-GOVERNMENTAL ORGANIZATIONS**

#### **BIRDLIFE INTERNATIONAL - BI**

Small, Cleo \* Senior Policy Officer, BIRDLIFE International Global Seabird Programme, RSPB, The Lodge, Sandy, Bedfordshire SG19 2DL, United Kingdom Tel: +44 1767 693 586, Fax: +44 1767 692 365, E-Mail: cleo.small@rspb.org.uk

#### Winnard, Stephanie \*

Birdlife International, The Lodge, Sandy, Bedfordshire, SG19 2DL, United Kingdom Tel: +44 1767 693 063, E-Mail: stephanie.winnard@rspb.org.uk

#### FEDERATION OF MALTESE AQUACULTURE PRODUCERS - FMAP

**Deguara,** Simeon Research and Development Coordinator, Federation of Maltese Aquaculture Producers - FMAP, 61, St. Paul Street, VLT 1212 Valletta, Malta Tel: +356 21223515; +356 21226268, Fax: +356 21241170, E-Mail: dsd@aquabt.com

#### **HUMANE SOCIETY INTERNATIONAL - HSI**

Abercrombie, Debra

Research Consultant, Humane Society International, 3299 NW 44th Street #6, Fort Lauderdale, FL 33309 Tel: +1 954 253 1265, E-Mail: debra.abercrombie@gmail.com

#### **INTERNATIONAL SEAFOOD SUSTAINABILITY FOUNDATION - ISSF**

Justel, Ana ISSF-Spain, C/ Francisco Giralte, 2, 28002 Madrid, Spain Tel: +34 91 745 3075, E-Mail: ajustel@iss-foundation.org

#### Restrepo, Víctor

Chair of the ISSF Scientific Advisory Committee, ISS-Foundation, 1440 G Street NW, Washington DC 20005, United States

Tel: + 1 703 226 8101, Fax: +1 215 220 2698, E-Mail: vrestrepo@iss-foundation.org; vrestrepo@mail.com

#### **PEW CHARITABLE TRUSTS - PEW**

Galland, Grantly

Pew Charitable Trusts, 901 E Street, NW, Washington, DC 20004, United States Tel: +1 202 540 6953, Fax: +1 202 552 2299, E-Mail: ggalland@pewtrusts.org

#### THE OCEAN FOUNDATION

**Boustany,** Andre M. \* Duke University, Nicholas School of the Environment Box 90328, Durham NC 27708, United States Tel: +1 831 402 1364, Fax: +1 919 613 8026, E-Mail: andre.boustany@duke.edu

#### Miller, Shana

The Ocean Foundation, 1320 19th St., NW, 5th Floor, Washington, DC 20036, United States Tel: +1 631 671 1530, E-Mail: smiller@oceanfdn.org

#### THE SHARK TRUST

**Fordham**, Sonja V Shark Advocates International, President, c/o The Ocean Foundation, suite 250, 1320 19th Street, NW Fifth Floor, Washington, DC 20036, United States Tel: +1 202 436 1468, E-Mail: sonja@sharkadvocates.org; sonjaviveka@gmail.com

#### Hood, Ali

The Shark trust, 4 Creykes Court, The Millfields, Plymouth PL1 3JB, United Kingdom Tel: +44 7855 386083, Fax: +44 1752 672008, E-Mail: ali@sharktrust.org

#### **UNIVERSITY OF NORTH CAROLINA**

#### Braun, Amy\*

University of North Carolina at Chapel Hill, Department of Geography, CB 3220 Chapel Hill, NC, 27599, United States Tel: +1 919 923 1068, Fax: +1 919 962 1537, E-Mail: ambraun@live.unc.edu

#### WORLD WILDLIFE FUND - WWF

**Buzzi,** Alessandro WWF, Via Po, 25/c, 00184 Roma, Italy Tel: +3906 84 4971, E-Mail: abuzzi@wwfmedpo.org

#### García Rodríguez, Raúl

WWF Mediterranean, Gran Vía de San Francisco, 8, 28005 Madrid, Spain Tel: +34 630 834 267, Fax: +34 913 656 336, E-Mail: pesca@wwf.es

#### SCRS CHAIRMAN

**Die**, David SCRS Chairman, Cooperative Institute of Marine and Atmospheric Studies, University of Miami, 4600 Rickenbacker Causeway, Miami Florida 33149, United States Tel: +1 673 985 817, Fax: +1 305 421 4221, E-Mail: ddie@rsmas.miami.edu

#### **ICCAT Secretariat**

C/ Corazón de María 8 – 6ª planta 28002 Madrid – SPAIN Tel: +34 91 416 56 00; Fax: +34 91 415 26 12; E-mail: info@iccat.int

#### ICCAT

Meski, Driss Neves dos Santos, Miguel Moreno, Juan Antonio De Bruyn, Paul Kell, Laurence Palma, Carlos Ortiz, Mauricio Mayor, Carlos De Andrés, Marisa García-Orad, María José Campoy, Rebecca Donovan, Karen Pinet, Dorothée Navarret, Christel Fiz, Jesús Gallego Sanz, Juan Luis García Piña, Cristóbal Martínez Guijarro, Ana Isabel Moreno, Juan Ángel Muñoz, Juan Carlos Parrilla, Alberto Thais Peña, Esther

#### **AOTTP PROGRAMME**

Beare, Doug Güemes, Pedro

#### ICCAT GBYP PROGRAMME

Di Natale, Antonio Tensek, Stasa

#### **ICCAT INTERPRETERS**

Baena Jiménez, Eva J. Faillace, Linda Liberas, Christine Linaae, Cristina Meunier, Isabelle Hof, Michelle R.

#### Appendix 3

#### List of 2017 SCRS Documents

Reference	Title	Authors
SCRS/2017/001	Report of the Bluefin Tuna data preparatory meeting	Anon.
SCRS/2017/002	Report of the Shortfin Mako shark data preparatory meeting	Anon.
SCRS/2017/003	Report of the Atlantic Swordfish data preparatory meeting	Anon.
SCRS/2017/004	Report of the Small Tunas species group intersessional meeting	Anon.
SCRS/2017/005	Report of the Working Group on Stock Assessment Methods meeting	Anon.
SCRS/2017/006	Report of the Albacore species group intersessional meeting	Anon.
SCRS/2017/007	Report of the Shortfin Mako shark stock assessment session	Anon.
SCRS/2017/008	Report of the Atlantic Swordfish stock assessment session	Anon.
SCRS/2017/009	Report of the Sub-Committee on Ecosystems Intersessional meeting	Anon.
SCRS/2017/010	Report of the Bluefin Tuna stock assessment session	Anon.
SCRS/2017/011	Report of the Tropical Tunas species group intersessional meeting	Anon.
SCRS/2017/012	Report of the Sub-Committee on Statistics meeting	Anon.
SCRS/2017/013	Alternative catch estimates from market and third party data	Apostolaki P., Pearce J., Barbari A., and Beddington J.
SCRS/2017/014	First report on cannibalistic feeding behaviour in post-flexion bluefin larvae ( <i>Thunnus thynnus</i> ) of the Balearic Sea (NW Mediterranean)	Uriarte A., Johnstone C., Laiz-Carrión R., García A., Quintanilla J.M., Reglero P., and Alemany F.
SCRS/2017/015	Estimation of conversion factor from curved fork length to straight fork length for farmed eastern bluefin tuna ( <i>Thunnus thynnus</i> )	Drakard V.F., Gatt M., and Camilleri T.
SCRS/2017/016	Development of a fishery independent index of abundance for Atlantic Bluefin tuna in the Gulf of St Lawrence	Melvin G.D., Munden J., and Finley M.
SCRS/2017/017	Food composition and feeding habits of little tunny ( <i>Euthynnus alletteratus</i> ) from the Tunisian Mediterranean coast	Hajjej G., Hattour A., Missaoui H., and Jarboui O.
SCRS/2017/018	Length-weight relationship for small tunas species caught by purse seine in the gulf of Gabes (Ionian sea-Mediterranean)	Hajjej G., Hattour A., Missaoui H., and Jarboui O.
SCRS/2017/019	Calculating population-wide spatial and seasonal relative abundance indices for Atlantic bluefin tuna for use in operational modelling	Carruthers T.
SCRS/2017/020	Standardized CPUE indices for Canadian bluefin tuna fisheries: 1981-2016	Hanke A.R., and Cheverie A.

SCRS/2017/021	Stock mixing rates of bluefin tuna from Canadian landings: 1975-2015	Puncher G., and Hanke A.R.
SCRS/2017/022	Validation of the growth equations applicable to the Atlantic bluefin tuna, <i>Thunnus thynnus</i> (L.), using Lmax, tag-recapture, length-weight relationships, condition factor and first dorsal spine analysis	Cort J.L., Estruch V.D., and Deguara S.
SCRS/2017/023	Review and update of the Catch at Age (CAA) for the Spain Bay of Biscay Bluefin tuna fisheries for 1950 – 2000	Cort J.L., Santiago J., Arrizabalaga H., Palma C., and Ortiz M.
SCRS/2017/024	Estimation of size at catch and potential growth of farmed Eastern Bluefin tuna ( <i>Thunnus thynnus</i> ) from farm harvest database	Ortiz M.
SCRS/2017/025	The standardized bluefin CPUE of Japanese longline fishery in the Atlantic up to 2017 fishing year	Kimoto A., and Itoh T.
SCRS/2017/026	Estimating the contribution of Atlantic Bluefin tuna sub-populations in the North Atlantic Ocean over the last 6 years	Fraile I., Arrizabalaga H., Kimoto A., Itoh T., Abid N., Rodriguez-Marín E., and Rooker J.
SCRS/2017/027	Genetic assignment of Atlantic bluefin tuna feeding aggregations to spawning grounds	Rodríguez-Ezpeleta N., Díaz- Arce N., Addis P., Abid N., Alemany F., Deguara S., Fraile I., Franks J., Hanke A., Itoh T., Karakulak S., Kimoto A., Lawretta M., Lino P., Lutcavage M., Macías D., Ngom Sow F., Notestad L., Oray I., Pascual P., Quattro J., Richardson D.D., Rooker J.R., Valastro M., Varela J.L., Walter J., Irigoien X., and Arrizabalaga H.
SCRS/2017/028	Integrated analysis for Atlantic bluefin tuna origin assignment	Brophy D., Duncan R., Hickey A., Abid N., Addis P., Allman R., Coelho R., Deguara S., Rodriguez Ezpeleta N., Fraile I., Karakulak S., and Arrizabalaga H.
SCRS/2017/029	Historical Size structure of Bluefin tuna purse seiner's catch: data recovered from Balfegó logbooks data (1985-2000)	Gordoa A., Balfegó M., Balfegó P.V., and Navarro J.
SCRS/2017/030	Update on the bluefin tuna catches from the tuna trap fishery off southern Portugal (NE Atlantic) between 1998 and 2016	Lino P.G., Rosa D., and Coelho R.
SCRS/2017/031	Las almadrabas de la corona de Aragón en los siglos XVI y XVII	Vidal-Bonavila J.
SCRS/2017/032	Annual indices of bluefin tuna ( <i>Thunnus thynnus</i> ) spawning biomass in the Gulf of Mexico (1977- 2016)	Ingram G.W.
SCRS/2017/033	Changes of bluefin tuna ( <i>Thunnus thynnus</i> ) larvae fishing methods over time in the western Mediterranean, calibration and larval indices updating	Alvarez-Berastegui D., Ingram Jr G.W., Reglero P., Ferrà C., and Alemany F.

SCRS/2017/034	A potential larval survival index for bluefin tuna ( <i>Thunnus thynnus</i> ) during 1990-2016	Reglero P., Balbín R., Alvarez-Berastegui D., Rasmuson L., Ortega A., Abascal F., Blanco E., Medina A., de la Gándara F., Mourre B., and Alemany F.
SCRS/2017/035	Report of the working group on multi-national pelagic longline index for western Atlantic bluefin tuna	Walter J., Lauretta M., Kimoto A., Hanke A., Ramirez K., and Melvin G.
SCRS/2017/036	Proposals for Atlantic bluefin tuna stock assessment models for 2017	Walter J.
SCRS/2017/037	VPA-2BOX model diagnostics used in the 2014 assessment of eastern Atlantic bluefin tuna	Zarrad R., Walter J., Lauretta M.
SCRS/2017/038	Standardized CPUE of bluefin tuna ( <i>Thunnus thynnus</i> ) caught by Moroccan Atlantic traps for the period 1986- 2016	Abid N., Malouli M., and Mhamed A.B.
SCRS/2017/039	Tentative recovery of historical bluefin tuna catches in the black sea: the Bulgarian catches 1950-1971	Di Natale A.
SCRS/2017/040	A peculiar situation for YOY of bluefin tuna ( <i>Thunnus thynnus</i> ) in the Mediterranean sea in 2015	Di Natale A., Tensek S., Celona A., Garibaldi F., Macias Lopez D.A., Oray I., Ortega García A., Pagá García A., Potoschi A., Tinti F.
SCRS/2017/041	The disappearance of young-of-the year bluefin tuna from the Mediterranean coast in 2016: is it an effect of the climate change?	Di Natale A., Tensek S., Pagá García A.
SCRS/2017/042	ICCAT GBYP tagging activities in phase 6	Tensek S., Pagá García A., Di Natale A.
SCRS/2017/043	Historical and recent data of Sicilian traps: the complexity in data recovery and interpretation	Pagá García A., Di Natale A., Tensek S.
SCRS/2017/044	Update of the abundance index for juvenile fish derived from aerial surveys of bluefin tuna in the western Mediterranean Sea	Rouyer T., Brisset B., Bonhommeau S., and Fromentin J-M.
SCRS/2017/045	Atlantic bluefin tuna area transition matrices estimated from electronic tagging and SATTAGSIM	Galuardi B., Cadrin S.X., Arregi I., Arrizabalaga H., Di Natale A., Brown C., Lauretta M., and Lutcavage M.
SCRS/2017/046	Captures, fréquences de taille et sex-ratio Thon rouge de la côte Algérienne	Krim A.K., Djerbal M., and Daoud N.A.
SCRS/2017/047	Blackfin tuna ( <i>Thunnus atlanticus</i> ) updates on catch, effort and size distribution from Venezuelan fisheries	Narváez M., Ariza L., Evaristo E., Bermudez R., Marcano J.H., Gutierrez X., and Arocha F.
SCRS/2017/048	A revision of the shortfin mako shark size distribution in the Atlantic using observer data from the main pelagic longline fleets	Coelho R., Domingo A., Courtney D., Cortés E., Arocha F., Liu K-M., Yokawa K., Yasuko S., Hazin F., Rosa D., and Lino P.G.
SCRS/2017/049	Standardized CPUE and size distribution of shortfin mako shark in the Portuguese pelagic longline fishery in the Atlantic	Coelho R., Rosa D., and Lino P.G.
SCRS/2017/050	Satellite tagging of shortfin mako for habitat use and post-release survival: progress report for SRDCP	Coelho R., Domingo A., Carlson J., Natanson L., Cortés E., and Miller P.

SCRS/2017/051	Progress on the Atlantic-wide study on the age and growth of shortfin mako shark: progress report for SRDCP	Rosa D., Mas F., Mathers A., Natanson L., Domingo A., Carlson J., and Coelho R.
SCRS/2017/052	Hooking mortality of swordfish in pelagic longlines: comments on the efficiency of the minimum retention size currently in place in ICCAT	Coelho R., and Lechuga R.
SCRS/2017/053	Standardized CPUE of swordfish in the Portuguese pelagic longline fishery in the Atlantic	Coelho R., Rosa D., and Lino P.G.
SCRS/2017/054	Revised standardized CPUE of shortfin mako ( <i>Isurus oxyrinchus</i> ) caught by the Japanese tuna longline fishery in the North Atlantic Ocean between 1994 and 2015	Semba Y., Kai M., and Yokawa K.
SCRS/2017/055	Bayesian surplus production models for shortfin mako sharks: are the results consistent when using different software packages?	Babcock E., and Cortes E.
SCRS/2017/056	Stock status indicators of mako sharks in the western North Atlantic Ocean based on the US pelagic longline logbook and observer programs	Cortes E.
SCRS/2017/057	Evaluation of environmental conditions as predictors for mako shark CPUE using generalized linear mixed modeling and quantile regression	Ofarrell H., and Babcock E.
SCRS/2017/058	CPUE, size and maturity of shortfin mako, <i>Isurus</i> <i>oxyrinchus</i> , caught by longliners in the Southwestern Atlantic Ocean	Mas F., Forselledo R., and Domingo A.
SCRS/2017/059	Standardized CPUE of shortfin mako, Isurus oxyrinchus, based on data gathered by the National Observer Program on Board the Uruguayan longline flee (2001-2012)	
SCRS/2017/060	Reproduction of Atlantic bonito ( <i>Sarda sarda</i> ) South of the Moroccan Atlantic waters	Baibbat S.A., Malouli I., Abid N., Kell L., Lucena F., and Benazzouz B.
SCRS/2017/061	Description of a fishing of two Mauritanian longline vessels generating excessive catches of sharks	Braham C.B.
SCRS/2017/062	Updated and retrospective estimates of shortfin mako ( <i>Isurus oxyrinchus</i> ) landings by the Spanish surface longline fishery targeting swordfish in areas of the Atlantic Ocean during the 1950-2015 period	González-González I., Fernández-Costa J., Ramos- Cartelle A., and Mejuto J.
SCRS/2017/063	Updated standardized catch rate of swordfish ( <i>Xiphias gladius</i> ) from the Moroccan longline fishery operating in the north Atlantic	Sid'Ahmed B., Abid N., Malouli M.I., and Benmhamed A.
SCRS/2017/064	A relative index of Atlantic Swordfish abundance based on Canadian pelagic longline data (2002 to 2016)	Hanke A.R.
SCRS/2017/065	Longline data simulation: a paradigm for improving CPUE standardization	Goodyear C.P., Schirripa M., and Forrestal F.
SCRS/2017/066	Testing robustness of CPUE standardization using simulated data: Findings of initial blind trials	Forrestal F.C., Goodyear C.P., Schirripa M., Babcock E., Lauretta M., and Sharma R.
SCRS/2017/067	Estimations of standardized catch rates of swordfish ( <i>Xiphias gladius</i> ) caught by Brazilian fleet as calculated using fixed and random effects	Oliveira E.S.C., Carneiro V.G.O., Rodrigues S.L., and Andrade H.A.
SCRS/2017/068	Update standardized catch rate of swordfish ( <i>Xiphias gladius</i> ) caught in the South Atlantic by the Brazilian fleet	Carneiro V.G.O., Rodrigues S.L., Oliveira E.S.C., and Andrade H.A.

SCRS/2017/069	Observed live releases and dead discards of shortfin mako shark ( <i>Isurus oxyrinchus</i> ) from Canadian fisheries	Bowlby H., Joyce W., and Fowler M.
SCRS/2017/070	Standardized catch indices of Atlantic swordfish, <i>Xiphias gladius</i> , from the United States pelagic longline observer program	Lauretta M. and Walter J.
SCRS/2017/071	Standardized catch rates of the shortfin mako ( <i>Isurus oxyrinchus</i> ) caught by the Taiwanese longline fishery in the Atlantic Ocean	Tsai WP., and Liu KM.
SCRS/2017/072	Length based indicators of Atlantic swordfish and bluefin tuna stock status	Hanke A.
SCRS/2017/073	A first approximation to relative habitat size for swordfish stocks	Arrizabalaga H, Kell L., and Coelho R.
SCRS/2017/074	Annual indices of swordfish ( <i>Xiphius gladius</i> ) spawning biomass in the Gulf of Mexico (1982- 2015)	Ingram W.G.
SCRS/2017/075	Update CPUE standardization of the Atlantic swordfish caught by Japanese longliners	Ijima H., and Yokawa K.
SCRS/2017/076	A framework for assessing highly migratory species using Data-Limited Methods	Smith M.W., Isely J.J., Sagarese S.R., Harford W.J., Cass-Calay S.L., and Cummings N.J.
SCRS/2017/077	Preliminary results on the comparison of CPUE and , size of swordfish, <i>Xiphias gladius</i> , caught with different longline gears in the Southwestern Atlantic Ocean	Forselledo R., Mas F., and Domingo A.
SCRS/2017/078	Standardized CPUE of swordfish, Xiphias gladius, based on data gathered by National Observer Program on board the Uruguayan longline fleet (2001-2012)	Forselledo R., Mas F., Pons M., and Domingo A.
SCRS/2017/079	Length-length and length-weight relationships of swordfish, <i>Xiphias gladius</i> , caught by longliners in the southwestern Atlantic Ocean	Forselledo R., Mas F., Ortiz M., and Domingo A.
SCRS/2017/080	Production et Effort de pêche sur l'espadon <i>Xiphias gladius</i> (Linnaeus, 1758) débarqué par des pêcheurs artisans en Côte d'Ivoire	Bahou L., Konan J.K., and N'Guessan C.D.
SCRS/2017/081	Tools to guide the selection of CPUE series – revisited and revised	Bruyn P.A., and Schirripa M. J.
SCRS/2017/082	Standardized joint CPUE index for bluefin tuna ( <i>Thunnus thynnus</i> ) caught by Moroccan and Portuguese traps for the period 1998-2016	Lino P.G., Abid N., Mohamed M.I., and Coelho R.
SCRS/2017/083	A brief review of Atlantic bluefin natural mortality assumptions	Lauretta M.
SCRS/2017/084	Implications for fisheries management in small tunas. The case study of bullet tuna in the West Mediterranean	Ollé J, Pérez-Bielsa N., Allaya H., Saber S., Macías D., and Viñas J.
SCRS/2017/085	Reproduction du thon à nageoires noires ( <i>Thunnus atlanticus</i> ) autour des DCP ancres de la Martinique	Pau C., Fauvel C., and Reynal L.
SCRS/2017/086	Estimating vulnerability of small tunas captured by longline and purse seine of the Atlantic Ocean	Frédou F.L., Kell L., Frédou T., Beare D., Abid N., and Andrade H.
SCRS/2017/087	Etude préliminaire de quelques paramètres de reproduction de <i>Auxis rochei</i> captures dans le golfe de Guinée par les pécheurs artisans	Diaha N.C., Amandé M.J., Konan K.J., Abekan E., and Bahou L.
SCRS/2017/088	Techniques de pêche utilisées en Martinique pour l'exploitation des grands poissons pélagiques du large	Flament M., Monet N., Pau C., and Reynal L.

SCRS/2017/089	Pêche des thonidés mineurs de l'Atlantique Centre Ouest	Reynal L., and Bealey R.
SCRS/2017/090	Annual indices of spawning biomass of little tunny ( <i>Euthynnus alletteratus</i> ) and common dolphin ( <i>Coryphaena hippurus</i> ) based on larval surveys in the Gulf of Mexico (1982-2015)	Ingram G.W.
SCRS/2017/091	Options for an Observation Error Model for North Atlantic albacore MSE	Merino G., Kell L.T., Arrizabalaga H., Santiago J., Sharma R., Ortiz de Zarate V., and De Bruyn P.
SCRS/2017/092	Uncertainty grid for North Atlantic albacore Management Strategy Evaluation: Conditioning Operating Models	Merino G., Kell L.T., Arrizabalaga H., Santiago J., Sharma R., Ortiz de Zarate V., and De Bruyn P.
SCRS/2017/093	Updated Evaluation of Harvest Control Rules for North Atlantic albacore through Management Strategy Evaluation	Merino G., Kell L.T., Arrizabalaga H., Santiago J., Sharma R., Ortiz de Zarate V., and De Bruyn P.
SCRS/2017/094	Spanish mackerel ( <i>Scomberomorus maculatus</i> ) larval indices of relative abundance from seamap fall plankton surveys in the Gulf of Mexico, 1986 to 2014	Hanisko D.S., Pollack A.G., Zapfe G., and Ingram G.W.
SCRS/2017/095	King mackerel ( <i>Scomberomorus cavalla</i> ) larval indices of relative abundance from seamap fall plankton surveys in the Gulf of Mexico, 1986 to 2014	Hanisko D.S., Pollack A.G., Zapfe G., and Ingram G.W.
SCRS/2017/096	Contribution à la biologie et la croissance de la bonite ( <i>Sarda sarda</i> ) des côtes Mauritaniennes	Diagne A., Djimera L., Dia M., and Beyah M.
SCRS/2017/097	Standardized catch rates for simulated longline data	Ortiz M.
SCRS/2017/098	Abundance indices of genus <i>Auxis</i> based on larval surveys In the Gulf of Mexico (1982-2015)	Ingram G.W.
SCRS/2017/099	Some methodological approaches to standardizing catch per unit effort in mixed fisheries: application to target species in the longliners of Morocco	Serghini M., Habiba H., and Aziza L.
SCRS/2017/100	A roadmap for CPUE standardization using simulated/observed data: proposed study	Sharma R., Cooper A., Coelho R., and Schirripa M.
SCRS/2017/101	SCRS Annual dashboard: a new tool to complement the management advice to the Commission	Santiago, J., H. Arrizabalaga, G. Merino, and H. Murua
SCRS/2017/102	North Atlantic swordfish biomass dynamic stock assessment revisited	Kell, L.T.
SCRS/2017/103	Des orientations pour la standardisation des captures par unités d'effort selon la stratégie de pèche et les variables environnementales: espadon et thon rouge de la méditerranée	Zarrad R., and Missaoui H.
SCRS/2017/104	An examination of bias in the East Atlantic and Mediterranean Bluefin stock assessment	Kell, L.T.
SCRS/2017/105	Updated standardized catch rates for the North Atlantic stock of swordfish ( <i>Xiphias gladius</i> ) from the Spanish surface longline fleet for the period 1986-2015	García-Cortés B., Ramos- Cartelle A., Fernández-Costa J., and Mejuto J.
SCRS/2017/106	Updated standardized catch rates for South Atlantic stock of swordfish ( <i>Xiphias gladius</i> ) from the Spanish longline fleet for the period 1989-201	Ramos-Cartelle A., García- Cortés B., Fernández-Costa J., and Mejuto J.

SCRS/2017/108Updated standardized catch rates of shortfin mako (Isurus oxyrinchus) caught by the Spanish surface longline fishery targeting swordfish in the Atlantic ocean during the period 1990-2015Fernández-Costa J., García- Cortés B., Ramos-Cartelle A and Mejuto J.SCRS/2017/109Standardization of CPUE for south Atlantic albacore by the Japanese longline fishery using revised methodMatsumoto T.SCRS/2017/110An alternative hypothesis for the reconstruction of time series of catches for North and South Atlantic stocks of shortfin mako sharkCoelho R., and Rosa D.SCRS/2017/111Age and growth of shortfin mako in the North Atlantic, with revised parameters for consideration to use in the stock assessmentRosa D., Mas F., Mathers A., Natanson L.J., Domingo A., Carlson J., and Coelho R.SCRS/2017/112A habitat model for northeast Atlantic Albacore swordfish in the North Atlantic (1999-2015)Goikoetxea, Chust G., Ibaibarriaga L., Sagarminag Y., and Arrizabalaga H.SCRS/2017/114Estimation of Mediterranean albacore fisheries' productivity using a Catch Based MethodMerino G., Arrizabalaga H., Santiago J., Ortiz de Urbina and Scott G.P.SCRS/2017/116Standardized CPUE of albacore ( <i>Thunnus alalunga</i> 2004-2015Saber S., Macías D., Rioja P., and Ortiz de Urbina J. 2004-2015SCRS/2017/116Overview of the Italian fleet fishing albacore ( <i>Thunnus alalunga</i> ) CPUE rates from the Mediterranean ItalianMariani A., Tserpes G., Carlson J., and Deil'Aquila M.	SCRS/2017/107	Standardized catch rates in number of fish by age for the North Atlantic swordfish ( <i>Xiphias gladius</i> ) inferred from the Spanish longline fleet for the	Mejuto J., García-Cortés B., Ramos-Cartelle A., and Fernández-Costa J.

# Report of the ICCAT Atlantic-Wide Research Programme for Bluefin Tuna (ICCAT GBYP)

(Activity report for the last part of Phase 6 and the first part of Phase 7 (2016-2017), including a general overview of the activities up to 2017)

# 1. Introduction

The ICCAT Atlantic-wide Research Programme for Bluefin Tuna (ICCAT GBYP) was officially adopted by the SCRS and the ICCAT Commission in 2008, and it started officially at the end of 2009, with the objective to:

- a) Improve basic data collection, including fishery independent data;
- b) Improve understanding of key biological and ecological processes;
- c) Improve assessment models and provision of scientific advice on stock status.

The total budget of the programme was estimated at about 19 million Euros for six years, and the European Union and some other Contracting Parties undertook to contribute to this programme in 2009 and in the following years; the budget officially approved by the ICCAT Commission in 2008 was 19,075,000 Euros for six years. The costs of the initial year were 653,864 Euros (against the original approved figure of 890,000 Euros), the costs of the second phase were 2,318,849 Euros (against the original figure of 3,390,000 Euros), while the costs of the third phase were 1,769,363 Euros (against the original approved figure of 5,845,000 Euros). The fourth phase had a total budget of 2,875,000 Euros (against the original approved figure of 5,195,000 Euros) and final costs were 2,819,557 Euros. The fifth phase had a total budget of 2,125,000 Euros (against the original approved figure of 3,345,000 Euros) and final costs were 1,995,787 Euros. The sixth phase had a total budget of 2,125,000 Euros (against the original approved figure of 410,000 Euros) and the final costs were 1,945,137 Euros. The seventh phase has a budget of 1,808,985 Euros. The overall ICCAT GBYP operating budget for the first seven phases, covering eight years (a total of 13,311,541 Euros) is about 69.78% of what it was supposed to be (the 19,075,000 Euros approved by the Commission), and it was used over 8 years instead of 6. Several private or public entities provided some additional funds or in kind support. These budget reductions have had an impact on all activities carried out so far even if the results were always well above the initial objectives.

The ICCAT GBYP funding is provided by voluntary contributions from the ICCAT Contracting Parties. The European Union has funded 80% of the budget for each Phase since the beginning of the programme. The remaining 20% has been provided by most of the CPCs having a bluefin tuna quota for the eastern stock and by other CPCs.

Taking into account that the funding of this programme is a serious constraint on its activities, the Steering Committee submitted a proposal for funding the ICCAT GBYP through an annual scientific quota. This proposal has been rejected by the Commission several times as well as other alternative proposals by some CPCs.

The Steering Committee has repeatedly stated that this programme is of great importance. For this reason, in 2014, the Steering Committee and the SCRS proposed to the Commission to extend the programme up to 2021 and the proposal was endorsed by the Commission along with the SCRS report, however funding is still an issue which needs to be solved. The second external review in 2016 stated that the ICCAT GBYP is a success and should further continue.

The detailed ICCAT GBYP report is presented as document SCRS/2017/139.

# 2. Coordination activities

# 2.1 ICCAT GBYP coordination

The sixth phase of the ICCAT GBYP officially began on 20 February 2016, following the signature of the Grant agreement for the co-financing of ICCAT GBYP Phase 5 (SI2.727749) by the European Commission. The partial results were presented to the SCRS and the Commission in 2016 (Di *et al.*, 2017) and they have been approved. The final report for Phase 6 has been officially approved by the European Union.

The seventh phase of the ICCAT GBYP officially started on 21 February 2017 following the signature of the Grant agreement for the co-financing of the ICCAT GBYP Phase 7 (SI2.752957) by the European Commission and will end on 20 February 2018.

The staff level (one Assistant and one Data base specialist, in support to the Coordinator) was resumed from May 2015. The ICCAT Secretariat has always provided the support necessary for ICCAT GBYP activities.

The ICCAT GBYP coordination activity has had a total cost so far in the amount of 2,395,429 Euros<sup>1</sup>, including many components and also all costs for the Steering Committee and the two external reviews in 2013 and 2016. This cost represents 18% of the total operative budget.

A total of eight calls for tenders and three invitations were issued in Phase 6, awarding a total of 20 contracts to various entities in Phase 6. Nine additional calls for tenders have been announced to date in the first part of Phase 7 and a total of 16 contracts have been awarded to date to various entities in Phase 7.

A total of 132 contracts have been awarded under the ICCAT GBYP up to the first part of Phase 7 to 102 entities, located in 24 different countries; many hundreds of researchers and technicians have been involved to date in the various ICCAT GBYP activities. This extensive and open participation in ICCAT GBYP activities is considered to be one of the best results of this research programme.

A total of 54 reports were produced in the framework of Phase 6 of the ICCAT GBYP. Several additional documents and reports have also been issued by the ICCAT GBYP for the needs of Steering Committee meetings. A total of 50 scientific papers were produced in Phase 6, while others will be published later on. A total of 16 reports have been produced in the first part of Phase 7, along with 17 scientific papers. The total number of reports produced by ICCAT GBYP up to the first part of phase 6 is 263, and 238 scientific papers have been published so far.

## 3. Steering Committee

The ICCAT GBYP Steering Committee is currently composed of the SCRS Chair, the west bluefin tuna Rapporteur, the east bluefin tuna Rapporteur and the ICCAT Executive Secretary. The external expert was has not been contracted yet.

The activity of the Steering Committee included regular correspondence by e-mail with the ICCAT GBYP coordination, which provided the necessary information, as well as a monthly report. In Phase 6, the Steering Committee held one meeting (30-31 July 2016), discussing various aspects of the programme including the plan for Phase 7, and providing guidance and opinions. In Phase 7 the Steering Committee held one meeting (7-8 March 2017), revisiting entirely the activities for Phase 7. All finalised reports of the Steering Committee are available <u>here</u>.

# 4. Data mining and data recovery

The total budget for data mining and data recovery activities over three years was 600,000 Euros; so far, the total expenditure for seven years of activities has been 612,801 Euros<sup>2</sup> (102.13% of the original budget), and much more data have been recovered than initially planned. Several SCRS meetings and workshops have been held on buefin tuna data, including the Symposium on Bluefin Tuna Traps. To date, the ICCAT GBYP objectives set for data recovery and data mining in these first Phases have been largely accomplished. The total cost for data mining and data recovery activities represents only 4.6% of the total operative budget over the first ICCAT GBYP phases.

<sup>&</sup>lt;sup>1</sup> The cost includes 380,950 Euros in the full Phase 6, which might be different at the end of the Phase.

<sup>&</sup>lt;sup>2</sup> Including the costs planned for Phase 7 (60,000 Euro), an amount which might be different at the end of the Phase.

The specific activity for recovering genetic data from ancient bluefin tuna samples that was carried out in the last part of Phase 4 and in the first part of Phase 5 was duly completed. An initial report (Melvin, 2015) was presented to the SCRS in 2015, while the final comprehensive report (with genetic data from the 2nd century B.C. to the early 1900s) was duly presented at the end of Phase 5. The data demonstrated the lack of any genetic erosion in the bluefin tuna population over these 22 centuries.

The data mining and data recovery activity continued according to the objectives recommended by the Steering Committee, concentrating efforts mostly on trap and LL data. A complete and detailed overview of the data recovered in the last period of Phase 6 and the first period of Phase 7 is available (SCRS/2017/031, SCRS/2017/039, SCRS/2017/40, SCRS/2017/041, SCRS/2017/042, SCRS/2017/043 and SCRS/2017/171, SCRS/2017/191). ICCAT GBYP data were used also in papers SCRS/2017/019, SCRS/2017/027, SCRS/2017/028, SCRS/2017/045, SCRS/2017/166 and SCRS/2017/169. The further analyses of the market and auction data provided to the ICCAT GBYP as a donation in kind (Mielgo, 2015) was presented to the SCRS bluefin tuna data preparatory meeting in March 2017 (SCRS/2017/013). All ICCAT GBYP data have been progressively incorporated in the ICCAT bluefin tuna data base, making them fully available for the SCRS.

The non-GBYP electronic tags data sets recovered in Phase 6, after the necessary checking, were sent (along with the ICCAT GBYP e-tags data) to the two experts defined by the SCRS (Lauretta and Carruthers) and used, together with other biological data, for assessing the mixing in the various areas, both for the bluefin tuna stock assessment and the ICCAT GBYP MSE-OM trials.

Furthermore, an updated bibliography for the bluefin tuna traps, also including video and audio documents, for a total of about 2,200 titles, was made available to the SCRS bluefin tuna species group (SCRS/2017/119).

## 5. Aerial survey

The ICCAT GBYP aerial survey on bluefin spawning aggregations was initially identified by the Commission as one of the three main research objectives of this programme, in order to provide fishery-independent trends and estimates on the minimum SSB. The original programme included a total of three surveys over a maximum of three areas, but this was later modified by the Steering Committee, and a first power analysis revealed that under the best possible conditions a minimum of six/seven surveys will be necessary for detecting a trend in the four main spawning areas.

The total original budget set for three surveys in three areas was 1,200,000 Euros; the cost of carrying out five surveys in many more areas (four main "internal" areas and seven "external" areas) is approximately 2,024,056<sup>3</sup> Euros (168.67% of the original budget, but with much more than twice the activities). So far, the ICCAT GBYP objectives initially set for the aerial survey on spawning aggregations in these first Phases have been largely accomplished, except for the calibration requested in the past by the Steering Committee, for which a detailed SWOT analysis clearly showed the difficulties for implementing it (see Di Natale, 2016). The costs for the aerial surveys represented so far just 15.21% of the total ICCAT GBYP operative budget and the last external review showed that they have been the lowest when compared to any other aerial survey carried out by other entities.

Two aerial surveys (2013 and 2015), according to the specific request of the Steering Committee, were conducted in a very extended area, including four "internal" areas and seven "external" areas, covering more than 60% of the Mediterranean Sea. The logistic of these extended surveys was extremely heavy and complex.

The Steering Committee, in Phase 5, requested a further complex and comprehensive analysis, including a cost/benefit analysis; the reports are available <u>here</u>. The data collected in Phases 4 and 5 confirmed the validity of the approach adopted in Phases 1 and 2, but at the same time confirmed the need for conducting several surveys before detecting any trend for a minimum SSB, due to the high variability of the oceanography in the Mediterranean Sea and the adaptive behaviour of bluefin tuna. The power analysis recommended to continue the survey in the four main spawning areas only.

 $<sup>^3</sup>$  Including the costs planned for Phase 7 (388,000  $\in$ ), an amount which might be different at the end of the Phase.

The ICCAT GBYP reviewers pointed out that the aerial survey is still one of the very few available methodologies for providing fishery independent indices and, if continued, it should be limited to the main spawning areas for the logistic problems linked to the extended survey.

Therefore, the ICCAT GBYP aerial survey was resumed in Phase 7, covering the four main spawning areas (Balearic Sea, southern Tyrrhenian Sea, central-southern Mediterranean Sea and Levantine Sea, for a total effective surface of 265,626 km<sup>2</sup>), according to the standardisation adopted in Phase 5. The survey in 2017 has been very successful, also thanks to the extremely supportive cooperation of the EU countries and Turkey. A new strategic approach allowed the ICCAT GBYP to have the reports checked in real time, and the analyses were provided just after one week to the SCRS bluefin tuna species group and then at the SCRS BFT Assessment Session (SCRS/2017/149). These standardised results allowed for the first time to the use of the ICCAT GBYP aerial survey data for the MSE and the OM. The abundance of bluefin tuna schools in 2017 was one of the highest registered so far, confirming the strong presence of the species.

Furthermore, the last survey was able to detect, in real time, a shifting in the abundance of bluefin tuna (less presence in the central-southern Mediterranean, with increased presence in all other areas), which was mirrored by the different strategy of the main purse-seine fleets, confirming the importance of this tool and the need to continue the survey over the four main areas in the next Phases.

# 6. Tagging

The initial, short-term ICCAT GBYP objective approved by the Commission in 2008 was to implant 30,000 conventional tags and 300 electronic tags in three years in the eastern Atlantic and Mediterranean, with a total budget of 9,765,000 Euros; the mandatory tag awareness and reward campaigns, as well as the tagging design study and protocol, were not included in the original budget. So far, with only 50.95% of the funding (a total of 4,975,482 Euros<sup>4</sup>), the ICCAT GBYP has deployed 85.96% of the conventional tags (25,587) and 128% of the electronic tags (384 in total; 326 mini PATs<sup>5</sup>, 50 internal archival tags and 8 acoustic tags). Furthermore, the tagging design and protocols, the awareness and reward campaigns have been included in the activity carried out to date. The costs for tagging in the first seven Phases represented 37.38% of the total ICCAT GBYP budget, and it is certainly the most important cost component of the programme. It is very clear that the general objectives set for the tagging activities in these first Phases have been largely accomplished and even exceeded so far in terms of the total number of tags to be deployed, taking into account the proportion of the available budget.

# 6.1 Conventional and electronic tagging activity

The tagging activities carried out up to the first part of Phase 6 were reported to the SCRS (SCRS/P/2016/139, SCRS/2016/138 and SCRS/2016/143). The final results of Phase 6 were included in the ICCAT GBYP Report to the EU and then reported to the SCRS at the 2017 bluefin tuna data preparatory meeting (SCRS/2017/042). Furthermore, the data sets obtained from miniPATs implanted in tunas that entered the Mediterranean Sea during the spawning season and coincided with the aerial survey, were used for the first time for a tentative assessment of an additional variance for the ICCAT GBYP aerial survey (Quilez Badía *et al.*, 2016).

The strategy adopted by the Steering Committee in Phase 7 was similar to the one enforced in Phase 5 and 6, excluding the conventional tagging (which was limited to the complimentary activities) and focusing the ICCAT GBYP activities only on the electronic tagging with miniPATs.

ICCAT GBYP issued two Calls for Tenders in Phase 6 and six contracts were awarded in 2016. Following the first set of three contracts (for the spring-summer activities), 14 miniPATs were deployed in a Moroccan trap (Larache), 19 (of a total of 20) miniPATs were implanted in tunas caught by a purse seiner in the Turkish area and 20 miniPATs were deployed in a Sardinian trap (Isola Piana). In the second set of contracts, for summer-autumn activities, 24 tags (over a total of 25) were deployed in a Portuguese trap, 15 tags (over a total of 21) were deployed in the Strait of Messina (including 3 complimentary tags provided by WWF) and 15 were planned for the Irish waters, but this contract was cancelled in July 2016 by the Steering

<sup>&</sup>lt;sup>4</sup> Including the costs planned for Phase 7 (290,000 Euro), which might be different at the end of the Phase.

<sup>&</sup>lt;sup>5</sup> Additional 40 miniPATs should be deployed in autumn 2017.

Committee. Most of these tags had a premature release, suspected to be mostly due to fishing operations but also due to some manufacturer problems that were noticed for the new type of the miniPATs. However some tags provided important results.

As concerns the tagging activities in Phase 7, two Call for tenders were issued, resulting in two contracts. A total of 40 e-tags were deployed in the Portuguese traps, while other 40 will be deployed in autumn in Danish and Swedish waters (13 tags have already been deployed). 33 tags, among those deployed in Portugal, had already popped off and four of them were moving towards the North Sea. A complimentary activity will be carried out by the *Korean National Institute for Fisheries Science* that will deploy 12 electronic tags in the Atlantic during their bluefin tuna fishing activity, sharing the data with the ICCAT GBYP.

The results of the electronic tagging activities not only provided new and totally unknown insights of several bluefin tuna movements, but finally support the results of the ICCAT GBYP genetic studies, which showed a full mixing in all bluefin tunas sampled in the Mediterranean Sea, without any evident isolation; they also confirmed that several bluefin tunas stay in the Mediterranean over winter.

The results from the tags deployed in Morocco in 2016 show that all tunas entered into the Mediterranean Sea, possibly for spawning. Even here, a re-analysis of the full data sets from the tags deployed in Morocco since the beginning of the ICCAT GBYP, along with the data concerning the fish natal origin obtained by the ICCAT GBYP micro-chemistry analyses, detected a possible solution for explaining why several tunas did not enter in the Mediterranean for spawning in some years. It seems that the highly variable percentage of western Atlantic-origin fish in the Moroccan traps could be a major motivation, although not the only one; this fact revealed another area of mixing that was previously unknown, with a very high interannual variability.

Additional complimentary tagging activities with conventional tags are being or have already been carried out in Phase 5, 6 and 7 in Canada, Ireland, Italy, Morocco, Portugal, Spain, United Kingdom and USA, while others are planned also in other areas. The full data will be available at the end of Phase 7.

In total, up to 20 September 2017, the total number of bluefin tunas tagged in all Phases of ICCAT GBYP is 18,407, and a total of 26,171 tags of various types have been implanted, mostly in juvenile bluefin tunas. Among these, 7,964 bluefin tunas were double tagged, amounting to 43.27% of the total tagged fish, a percentage which is well over the target (set at 40%).

An analysis about the migration into the Mediterranean Sea of bluefin tunas tagged in the Atlantic Ocean (detected with both electronic and conventional tags) was requested by the SCRS bluefin tuna species group during the 2017 bluefin tuna data preparatory meeting and duly provided by the ICCAT GBYP at the SCRS bluefin tuna assessment session (SCRS/2017/131). The ICCAT GBYP tag data have been used also in the paper SCRS/2017/177.

These last activities and results show how important the tagging activity is and how essential it is to continuously refine both the objectives and the comprehensive analyses, taking into account the many ICCAT GBYP (and other) research projects and the extremely complex and adaptive behaviour of bluefin tuna. These results clearly show the great interest of ICCAT GBYP tagging activities, which are able to provide inputs for a more realistic management of the bluefin tuna stocks.

# 6.2 Tag awareness and tag recovery activities

According to the recommendations provided by the Steering Committee in all meetings, the ICCAT GBYP continued the tag awareness campaign, for the purpose of improving the tag recovery and reporting rates. Further, thousands of awareness material in 12 languages (posters and stickers) were produced and distributed in all Phases. Details are available <u>here</u>. Specific training was provided yearly to ICCAT ROPs (except in Phase 6, when this training was not authorized), requesting that they pay maximum attention to tags (including natural marks) when observing harvesting in cages or any fishing activity at sea. A <u>field tag awareness programme</u> was developed in 2014 in which several countries have been visited, and contact made directly with local authorities, fisher organizations, tuna factories, tuna traps, observers and sport fishers:

The tagging awareness campaign is coupled with a tag reward campaign which includes substantial rewards, special T-shirts and increased annual lottery prizes. The ICCAT GBYP also provides immediate feedback to the tagging teams and the tag recovery persons, informing them about the history of each tag.

To improve information and tagging programme awareness, the ICCAT GBYP is developing contacts with various stakeholder organizations and journalists. Information on the ICCAT GBYP is now present on various websites, while some articles have been published in local newspapers.

A short video on ICCAT GBYP tagging activities, along with a spot, were produced in Phase 6, following a Call for tenders. The videos and spots were translated in 8 languages and were presented at the SCRS meeting in September 2016. While it is now available for free download, it is envisaged to develop the ICCAT GBYP bluefin tuna tagging visibility campaign and use these video materials for this purpose, by distributing them to main TV stations and other media in Mediterranean CPCs. Some CPCs had already used the videos on national television channels. All videos are uploaded on <u>YouTube</u> as a preview and their download in the high quality is easily available on request. For better informing all ICCAT CPCs and scientists about the possibility to freely use these videos and spots, the Secretariat released ICCAT Circular #0361/2017 (on 1 March 2017), with all the details. So far, the ICCAT GBYP videos had 3,127 visualisations in 71 countries.

A total of 648 tags (602 conventional tags, 26 mini-PATs, 13 archival tags, 4 commercial tags and 3 acoustic tags) from bluefin tunas have been reported to ICCAT GBYP up to 19 September 2017, showing a very substantial improvement in the total number of reported tags (see details in SCRS/2017/139). Even if the tag reporting rate is still low (2.48% of the total deployed tags of various types, 2.39% for the conventional tags only), comparing the mean annual bluefin tuna tag reporting rate to the ICCAT one for the eight years (2002-2009) prior to the ICCAT GBYP (0.88 tags/year) and the current reporting rate for the full period of the ICCAT GBYP up to 19 September 2017 (87.37 tags/year), the increase is about 9,928%. As a matter of fact, the tag reporting continuously increased in the years when the conventional tagging activities were carried out and continued even when the conventional tagging was cancelled.

Furthermore, the double tagging activity planned for studying the shedding rate of the different types of spaghetti tags and the specific recoveries reported so far (from 202 fish, with a reporting rate of 2.34%) showed that the results between single-barb spaghetti and double-barb spaghetti are quite comparable, because the single-barb ones were still on the fish in 80.69% of the cases, compared to 79.21% of the double-barb ones. The shedding rate was 40.1%.

# 6.3 Close-kin genetic tagging

Close-kin genetic tagging (now usually called Close-kin mark recapture, CKMR) is a technique which may provide an estimation of the total abundance and the spawning stock biomass, under the condition to have a very limited number of spawning grounds and a very good and extended sampling, either for spawners and juveniles. It seems to work for southern bluefin tuna and it is now currently used by the CCSBT Commission for assessing this species.

The Steering Committee, in Phase 5, recommended to fund the first part of the feasibility study for Close Kin Genetic Tagging. After a Call for tenders, a contract was awarded and the report was provided in the very last part of Phase 5. The first part of the CKMR feasibility study report provided by the contractor showed some problems in the part of the contents concerning the east bluefin tuna reproductive biology and therefore it was later revised various times. Therefore, the Steering Committee decided to have a refined and revised report in Phase 6, before going on with the dedicated genetic workshop and the second part of the CKMR feasibility study. Both these latter activities were postponed at least to Phase 8.

In Phase 6, the Steering Committee decided to start collecting the necessary samples for practically testing the feasibility and real costs for carrying out a CKMR study for the eastern bluefin tuna; the enhanced sampling was continued in Phase 7; this part is better described under point 7 of this document.

# 6.4 Other activities related to tagging

In order to better assess the post-release mortality in tag-and-release activities, and following the recommendation of the ICCAT GBYP Steering Committee, the GBYP is supporting a complimentary study which was proposed by the Croatian Institute for Oceanography and Fisheries. This study is using fish

caught by a purse-seine and moved into a cage, where the tag and release activity (usually carried out by sport fishers) will be tested. The results of this study will be made available at the end of Phase 7.

A new and useful electronic tag data base with a Shiny application has been developed by ICCAT GBYP in Phase 7 and it is now available for the SCRS scientists (SCRS/2017/192). The application allows for an easy visualisation of the data and particularly the tracks.

# 7. Biological studies

The initial, short-term ICCAT GBYP objective approved by the Commission in 2008 was to collect samples from 12,000 fish (including western Atlantic and the Japanese catches and markets) and carry out aging, genetic studies, and micro-constituent analyses in three years in the eastern Atlantic and Mediterranean, with a total budget of 4,350,000 Euros. So far, with only 59.75% of funding (a total of 2,598,525 Euros<sup>6</sup>), the ICCAT GBYP collected samples from 12,771 fish (106.4% of the target) up to Phase 6 and carried out ageing, genetic and micro-constituent analyses; furthermore, the sampling design, the sampling protocols and the otolith shape analyses were included in the activity carried out so far. Additional 2,130 fish should be sampled in Phase 7, bringing the total to 14,901 fish, about 124.2% of the objective, but with just about half of the budget. The amount of funds used for biological studies in the first seven Phases represents 19.53% of the total budget available so far for ICCAT GBYP. It is very clear that the general objectives set for the biological studies in these first Phases were largely accomplished so far, even without taking into account the proportion of the available budget.

An SCRS meeting was organized in May 2013 in Tenerife for reviewing the bluefin tuna biological parameters and the report is available <u>here</u>. The latest data were reported to SCRS Plenary in 2016 (Di Natale A., *et al.* 2017). The details of the sampling areas were revised jointly by the ICCAT GBYP coordination and the Steering Committee prior to the field activities in 2016 and 2017 and now there are 12 areas, 38 strata and 79 substrata, allowing for detailed analyses. At the SCRS bluefin tuna data preparatory meeting in 2017, new biological data were presented (see documents SCRS/2017/040, SCRS/2017/041). The last update regarding the situation of the ICCAT GBYP biological studies in Phase 7 was reported to the SCRS in document SCRS/2017/139.

The Steering Committee, in Phase 6, requested ICCAT GBYP to start trying the collection of an additional number of samples from the four main spawning areas in the Mediterranean Sea, to be used for a CSMR trial, also with the purpose to better assess the feasibility and the costs. After several contacts with the industry and the farms, several invitations have been circulated and the first three contracts were released, covering three of the four main spawning areas (with 300 adult fish minimum to be sampled by area).

A Call for tenders was released to cover the usual annual needs in terms of sampling and analyses, but in Phase 6 it also included the additional needs for CKMR samplings, as decided by the Steering Committee. Furthermore, following specific ICCAT GBYP scientific needs, it was also decided to include a comparison of the genetic results obtained using only SNPs, re-analysing the same samples using micro-satellites, in order to have a further confirmation. Another Call was released after the Steering Committee meeting in July, requesting a considerable amount of additional ageing analyses. A contract for biological sampling and analyses was awarded to a large Consortium of 14 entities and 7 sub-contracted entities, belonging to 8 different countries. The Call for tenders for additional aging analyses received no bids.

A ICCAT GBYP workshop for larval studies and surveys was held in Madrid on 12-14 September 2016, with the participation of scientists from EU, Japan and USA, updating knowledge and needs for developing this fishery independent index. The report was presented as SCRS/2016/176.

In Phase 7, the Steering Committee recommended a broader list of biological studies, along with the continuation of the additional sampling activities for CKMR purposes. Four invitations were provided for the additional sampling, resulting in three contracts, while another invitation was issued for an extensive ageing of 2,000 fish, resulting in one contract. A Call for tenders was issued for the other sampling activities and analyses, resulting in three contracts.

<sup>6</sup> Including the costs planned for Phase 7 (539,000 Euro), an amount which might be different at the end of the Phase.

In total, 12,771 bluefin tunas have been sampled up to February 2017 and about 40% have already been analysed; additional samples will be analysed in Phase 7, even if most of the genetic and micro-chemical analyses have been postponed to Phase 8. The list of available biological samples by type (muscle/fins, otoliths, spines), already stocked in the ICCAT GBYP tissue bank, currently maintained by AZTI, was circulated during the bluefin tuna intersessional meeting in July 2016 and again at the bluefin tuna data preparatory meeting in March 2017.

The first results, which can still be considered preliminary, are extremely interesting and very promising:

- Genetic analyses show that there is a clear genetic difference between the western Atlantic bluefin tuna and the eastern Atlantic bluefin tuna, and a certain mixing is present in almost all areas, with different proportions and with a high interannual variability. At the same time, for the eastern Atlantic stock, it is evident that there are no subpopulations within the Mediterranean and the intra-Mediterranean mixing is very evident. These results were confirmed with all genetic analytical methods.
- Microchemistry analyses showed that the current main stock components are well identified. Mixing in the Mediterranean Sea is minimal. The presence of important percentages of bluefin tuna from different areas in the central-North Atlantic and the Atlantic Iberian-Moroccan need to be investigated much more and further checked before having more solid results, however, it seems that the two stocks can be present there, with a very high interannual variability. These data were used for the MSE and the OM.
- A variable percentage of bluefin tuna cannot be currently attributed to any of the two stocks. This fact might be related to various factors, including the possible occurrence of additional spawning areas in the Atlantic Ocean, and it shall be further studied in the future. A study for the NW Atlantic area has been committed in Phase 7.
- The otolith shape analyses showed that bluefin tuna population components show some differences in shape. The otolith shape is better for describing the life history of the fish more than clearly detecting the origin in most of the cases.
- A first ageing calibration was carried out in 2014, with broad participation from scientific institutions and scientists belonging to several CPCs. The initial results show good improvements and similar exercises for smoothing the biases, which are essential for more accurate ageing of bluefin tuna, must be continued. The ICCAT GBYP ALK provided additional data in Phase 6, which were passed immediately to the SCRS bluefin tuna species group. A massive ageing of otoliths collected in previous ICCAT GBYP phases and stored in the ICCAT GBYP tissue bank in currently ongoing.

# 8. Modelling approaches

The initial, short-term ICCAT GBYP objective which was approved by the Commission in 2008 was to carry out operating modelling studies from year 4, with a total budget of  $\leq 600,000$ . So far, with 117.5% of the funds (a total of  $\leq 704,848^7$ ), the ICCAT GBYP carried out many modelling activities from Phase 2, following the recommendations of the Steering Committee and the SCRS. It is very clear that the general objectives set for the modelling studies in these first Phases have been, to date, largely accomplished taking into account both the needs to develop a MSE and the proportion of the available budget. Furthermore, the modelling plan was fully revised and now it has been extended up to 2021, as it was endorsed by the Commission. The total amount of funds set for the modelling approaches in the first Phases represents only the 5.3% of the total ICCAT GBYP budget available so far.

Five meetings of the ICCAT GBYP Core Modelling MSE Group have been held so far, setting and updating the Modelling Plan and to revise the actions and their development. The reports are available <u>here</u>. The list of members of the ICCAT GBYP Core Modelling MSE Group was updated in Phase 5 and then again in Phase 6, taking into account the new bluefin tuna rapporteurs and the SCRS Chairman.

<sup>&</sup>lt;sup>7</sup> Including the costs planned for Phase 7 (174,000 Euro), which might be different at the end of the Phase.

A Modelling coordinator and a modeling technical assistant were contracted in Phase 5, according to the decision taken by the Steering Committee. The contract for the modelling assistant was extended also to Phase 6 and 7, while the Steering Committee decided not to extend the contract for the Modelling coordinator, which will possibly be replaced by a Modelling communicator.

An ICCAT GBYP VPA training course was held in Miami on February 2017. 11 scientists attended the course from different ICCAT CPCs. The training was kindly provided by Dr. Laurie Kell, Dr. Ai Kimoto and Dr. Clay Porch. A technical meeting for conducting a SAM assessment was held in Madrid in May 2017. The results are presented in SCRS/2017/146.

The documents concerning the various products developed within the modelling approaches in all Phases are available <u>here</u>. New information was provided to the bluefin tuna intersessional meetings in 2016 (see documents SCRS/2016/144, SCRS/2016/145 and SCRS/P/2016/033) and in 2017 (SCRS/2017/178). All details regarding the ICCAT GBYP activities for the Modelling Approaches are provided in document SCRS/2017/139.

The data obtained from the electronic tagging activities have been included in the trials, including all those recovered in Phase 6 and all the ICCAT GBYP e-data sets. In 2017, for the first time, the ICCAT GBYP aerial survey data were also used for the OM. The work necessary for developing new modelling approaches will take several years, however, according to what was pointed out during the recent ICCAT GBYP review, the results of the modelling efforts will result in a much more focused research activity for the future.

All the ICCAT GBYP data were moved into the ICCAT system almost in real time in each Phase, after being accepted by the ICCAT SCRS Sub-committee on Statistics, while others were provided directly to the specialist identified by the SCRS bluefin tuna species group. In the first part of Phase 7 the great majority of the ICCAT GBYP data was used in the 2017 bluefin tuna stock assessment, in the MSE and in the OM. **Table 1** shows the details.

## 9. Legal framework

ICCAT adopted Rec. 11-06 in its meeting in Istanbul (November 2011), which allows for a "research mortality allowance" of 20 t of bluefin tuna per year for the ICCAT GBYP and for the use of any fishing gear in any month of the year in the ICCAT Convention area for ICCAT GBYP research purposes. To implement the recommendation, the ICCAT Secretariat issues one or more circulars in each year of the ICCAT GBYP activity.

A total of 245 ICCAT GBYP RMA certificates have been issued up to 1 September 2017, for a total of about 11,519 kg of bluefin tuna in the last 6 years (SCRS/2017/139), but the sampling activity is ongoing.

# **10. Cooperation with ROP**

The ICCAT GBYP coordination, together with the ICCAT Secretariat, is maintaining and improving the contacts with the ROP observers, to strengthen the cooperation and provide opportunities. The ROP observers are engaged in directly checking the bluefin tuna at harvest for improving tag recovery and reporting. The observers are also requested to report any natural mark and a specific form was provided by the ICCAT GBYP to ROPs. The specific training, yearly provided by the ICCAT GBYP Coordinator to the ROP, has been suspended since 2016. Several tags have been reported by ROPs in the last years. The trials for collecting additional biological samples which were agreed with the ROP in Phase 7, will be evaluated at the end of the Phase.

# **11. ICCAT GBYP Web page**

The ICCAT GBYP web page, which was created in the last part of Phase 1, is usually updated regularly with all documents produced by the ICCAT GBYP. In some cases, due to the huge workload, some sets of documents are posted all together. Updates also includes the budget page, where all contributions (monetary or in kind) are regularly listed, to ensure full transparency. The ICCAT GBYP web pages have recently been fully revised and improved.

# 12. Following activities

The ICCAT GBYP Steering Committee, recommended the following activities for Phase 8:

- a) *Data recovery and data mining*: If additional reliable data regarding any bluefin tuna fisheries in the last decades or other additional data sets, not already included in official Task II data, are detected, then these data should be recovered and used for improving our understanding of these fisheries. Efforts will be done for recovering the historical bluefin tuna catches from the ICES area.
- b) *Aerial survey*: after the good results of the last survey in 2017, the aerial survey should continue, carrying out the activity only on the four overlapping areas.
- c) *Tagging*: Electronic tagging should be partly carried out, focusing the distribution of tags according to the emerging needs set by the SCRS. Tag awareness activity will be continued, possibly improving communications with the media by using the video tools developed in Phase 6. If availability is confirmed by the external specialist, the second part of the CKMR feasibility study will be done, taking into account the preliminary trials for collecting dedicated samples in Phase 6 and 7. Furthermore, the CKMR genetic workshop should be organised.
- d) *Biological and genetic sampling and analyses*: Sampling should be continued, covering the less sampled areas or those where mixing problems have recently been detected; the analyses of the available samples should be improved, particularly for microchemistry, genetics and ageing, the latter taking into account the dedicated effort carried out in Phase 7. The trials for obtaining additional samples for CKMR shall be continued.
- e) *Modelling*: New additional efforts should be devoted to work on the best approaches to use fishery independent data and innovative approaches to better quantify uncertainties. The dialogue with stakeholders shall be activated and thoroughly improved. The revised plan should be enforced, according to the outputs of the ICCAT GBYP Core Modelling MSE Group. The modelling capacity building shall be further improved.

The total budget necessary for Phase 7 is provisionally set once again at €2,125,000.

The ICCAT GBYP will continue to encourage and support additional research activities carried out by the various CPCs.

*Evolution of the Atlantic-Wide Research Programme for Bluefin Tuna*: According to the current situation, it has been fully demonstrated that it is impossible to reach the level of funding initially approved by the ICCAT Commission for the first six years of the ICCAT GBYP and, as a consequence, to carry out the various activities as originally planned. The extension of the programme up to 2021 was discussed and endorsed by the Commission in 2014, following the SCRS recommendation. However, the ICCAT GBYP funding system should be revised and better defined, stabilised and improved, in order to ensure the regular development of the activities. Regardless of the type of system envisaged, the budget by Phase or year, subject to the Commission's approval, must be ensured.

The second external review (see SCRS/2016/192) provided an independent overview of the work carried out so far and possible proposals for the following extension, underlying that the ICCAT GBYP should become an institutional and continuous stream of scientific data.

**Table 1**. Details on the use of ICCAT GBYP data up to the first part of Phase 7 in the stock assessment, in the MSE and in the OM.

Activity	Use in the BFT Stock Assessment	Use in the BFT MSE and OM
Data mining and data recovery	size data, LL CPUE, historical trap data, BB data, non-GBYP electronic tagging data	size data, LL CPUE, historical trap data, BB data, non-GBYP electronic tagging data, historical genetic data
Aerial survey on BFT spawning aggregation	not so far (too short series)	yes
Tagging	conventional tag data, growth data, electronic tag data	conventional tag data, electronic tag data
Biological studies	genetic and microchemical data (mixing), ALK, reproductive characteristics, L/W correlation	genetic and microchemical data (mixing by area), ALK, reproductive characteristics, L/W correlation
Modelling approaches	SAM application, VPA training course	MSE and OM development, Modelling Multi-Year Plan

#### **Report of the ICCAT Enhanced Programme for Billfish Research (ICCAT/EPBR)** (Expenditures/Contributions 2017 and Programme Plan for 2018)

## **Summary and Programme objectives**

The ICCAT Enhanced Programme for Billfish Research (EPBR) continued its activities in 2017. The Secretariat coordinates the transfer of funds and distribution of tags, information, and data. The overall programme coordinator and western Atlantic coordinator during 2017 was Dr. John P. Hoolihan (USA). Dr. Fambaye Ngom Sow (Senegal) was the 2017 coordinator for the eastern Atlantic.

The original plan (1986) for EPBR included the following objectives: (1) to provide more detailed catch and effort statistics, particularly for size frequency data; (2) to initiate the ICCAT tagging programme for billfish; and (3) to assist in collecting data for age and growth studies. During past Billfish Species Group meetings, the Billfish Species Group requested that the objectives of EPBR expand to evaluate adult billfish habitat use, study billfish spawning patterns and billfish population genetics. The Billfish Species Group believes that these studies are essential to improve billfish assessments. Efforts to meet these goals during 2016-2017 are highlighted below.

The programme depends on financial contributions, including in-kind support, to reach its objectives. This support is especially critical because the largest portion of billfish catches in recent years comes from countries that depend on the support of the programme to collect fishery data and biological samples. ICCAT has provided financial support in recent years, while annual contributions have been made by Chinese Taipei since 2009.

## 2017 Activities

*Brazil:* No allocated funds from EPBR were requested from Brazil in 2016-2017.

*Ghana:* Billfish catch and effort data derived from artisanal fleets operating along the Ghanaian coast is ongoing.

*Côte d'Ivoire:* Improved data collection methods and reporting of Task I and II data to ICCAT have been achieved for the artisanal fleets. Rigorous biological sampling on a monthly basis is being carried out. Started in 2015, this project seeks to determine the stages of sexual maturity, the periods of reproduction, the fertility and the dietary habits of sailfish.

*São Tomé and Principe:* Collection of billfish landing data from artisanal fisheries has continued in São Tomé and Principe, the collection of fishery statistics continued in 2017. A total 562 t catch of billfish was reported for 2016.

*Senegal:* Field surveys of billfish catches by the artisanal fleet are carried out by the Oceanographic Research Centre of Dakar/Thiaroye. Catch and effort, and size frequency data were collected during 2016-2017. In total 589 t of sailfish and 69 t of blue marlin were reported.

*Venezuela:* At-sea sampling activities of INIA/IOV-UDO were discontinued in 2015 because of the difficulties of transferring funds to Venezuela in a way that would allow those funds to be used for the project activities. Throughout 2017 contacts have been made between Venezuela and the Secretariat aiming to sign a Memorandum of Understanding that would allow reinstatement of the programme in Venezuela. This important historical data source was based on landings out of the port of Cumaná, where the fleet of industrialized longline vessels target yellowfin tuna and swordfish, but also catch billfish. The reinstatement of this programme is needed to ensure long-term continuity of billfish data collection in the Caribbean.

*United States:* Dr. Mahmood Shivji, Nova Southeastern University, continued his research collaborations involving genetic analyses of white marlin and spearfishes using samples collected by NOAA Southeast Fisheries Science Center (US), Venezuela, Uruguay, and Brazil.

Genetic sampling kits continued to be distributed to a number of fleets to help identify the percentage of white marlin, longbill spearfish and roundscale spearfish in the mixture of landings that represent these three species.

## 2018 Plan and activities

The highest priorities for 2018 are to support the objectives established by the billfish work plan and those of the EPBR, with specific emphasis on the collection and preparation of data relevant to the identification of white marlin and spearfishes and the collection of biological data on spearfishes:

- support the collecting and processing of samples of billfish for genetic studies,
- support the monitoring of the Brazilian, Uruguayan and Venezuelan fleets through onboard observers, reporting of conventional tags, and biological sampling,
- support the collection of biological samples in West Africa,
- support the monitoring of billfish catches from West African artisanal fishing fleets,
- investigate possible unreported important billfish catches in the Caribbean, and take steps to develop capacity building where feasible.

All these activities depend on successful coordination, sufficient financial resources and adequate in-kind support. Details of EPBR funded activities for 2018 are provided below.

## Shore-based sampling

Sampling of artisanal and small scale fisheries to support the estimation of catch and effort statistics will be focused on fleets contributing the largest parts of the catch and/or those having traditionally provided the higher quality data in the past, to ensure the preservation of an uninterrupted time series of catch and relative abundance indices. In the western Atlantic, sampling at landing sites will be conducted for artisanal gillnet landings off central Venezuela, pending available funds. In the eastern Atlantic, monitoring and sample collection will be supported for the artisanal fisheries of Côte d'Ivoire, Ghana, São Tomé and Senegal.

## At-sea sampling

In the western Atlantic, continued support will be provided to the sampling made onboard the Venezuelan vessels.

# Tagging

The programme will need to continue to support the conventional tagging and recapture reporting conducted by programme partners.

# **Biological studies**

The biological and genetic sampling programmes, particularly for white marlin and spearfish, will continue in 2018.

Results from the Atlantic wide study on genetic differentiation of sailfish led by Brazilian scientist in collaboration with other National scientists was presented to the Group (SCRS/2017/218), preliminary results indicated that sailfish show at least two lineages, but a lack of population structuring between the analysed regions. Thus research is ongoing with the need for a pervasive genetic analysis with a higher resolute molecular marker to investigate the relationship between these lineages and ultimately if there is a need for differential management.

Continued efforts to collect biological samples for reproduction, age and growth studies for all billfish species requires EPBR support to facilitate cooperation from fleets that are monitored with EPBR funds.

# Coordination

## Training and sample collection

Programme coordinators need to travel to locations not directly accessible to promote EPBR activities and ICCAT data requirements regarding billfish. This includes travel to West African countries, as well as the Caribbean and South America by the general coordinator and the coordinator from the west. Coordinated activities between EPBR, JCAP and ICCAT data funds will continue to be required.

## Programme management

Management of the EPBR budget is assumed by the programme coordinators, with the support of the Secretariat. Reporting to the SCRS is a responsibility of the coordinators. Countries that are allocated budget lines for programme activities need to contact the respective programme coordinators for approval of expenditures before the work is carried out. Invoices and brief reports on activities conducted need to be sent to the programme coordinators and ICCAT to obtain reimbursement. Funding requests need to follow ICCAT protocol for the use of funds (see Addendum 2 to Appendix 7 of *Report for Biennial Period 2010-2011*, *Part II (2011), Vol. 2*).

# **2017 Budget and Expenditures**

This section presents a summary of the contributions and expenditures for the ICCAT EPBR during 2016. The Billfish Working Group developed a budget of €69,747.44 for the EPBR. The contributions made to the EPBR for the 2016 programme were €20,000.00 from the regular ICCAT budget and €3,000 from Chinese Taipei. Carryover funds remaining from the previous year were €61,184.16, thus total funds available for 2016 were €84,184.16 (**Table 1**). Expenditures to-date in 2016 have been €3023.00, with an additional €49,777.00 committed to other activities that have either taken place during January-September 2016 or are anticipated during October-December 2016. One of the main reason for the smaller expenditures has been the delay in receiving adequate numbers of genetic samples for processing. The estimated balance of EPBR funds at the end of 2016 is €31,384.16 (**Table 1**).

Income			Euros (€)
	Balance transferred fr	om 2016	75,671.16

## 2018 Budget and requested contributions

The proposed 2018 budget, totalling  $\notin$ 49,771.16 is detailed in **Table 2**. The programme is predicted to have a balance of  $\notin$ 46,771.16 by the end of 2017 and therefore requests the Commission to provide a contribution of  $\notin$ 0.0 for 2018. To achieve all its objectives in 2018 the programme will continue to require contributions of  $\notin$ 3,000.00 from other sources, such as those so generously provided lately by Chinese Taipei.

Development of improved age and growth curves and estimates of maximum longevity of billfishes has been recommended by the Group. **Table 2** continues to include research funding allocations to conduct biological sampling for age and growth of sailfish and blue marlin in the eastern Atlantic. Currently, no age and growth information is available for the eastern stock of sailfish, or blue marlin caught in that region.

The consequence of the programme failing to obtain the requested budget will be to stop or reduce programme activities for 2018 including: (1) collection and processing of genetic samples, collection and processing of age and growth samples, (2) at-sea observer trips in Brazil and Venezuela, (3) biological sampling and collection of statistics of catches from fleets in the western and eastern Atlantic, (4) promotion of conventional tagging activities, including distribution of tag recovery incentives. All these activities are critical to continue the improvement of the information available to the SCRS for billfish stock assessments.

## Conclusion

The EPBR is an important mechanism towards completing the goal of having the highest quality information to assess billfish stocks. The EPBR has been credited for major improvements in the data supporting the last ICCAT billfish assessments. The EPBR is the only programme that focuses exclusively on billfish. Therefore programme continuation is paramount to facilitate the collection of biological and fishery information on billfish species. The EPBR will continue to require support from ICCAT and other sources to operate and address the needs of the Commission.

# Report of the ICCAT Small Tunas Year Research Programme (ICCAT/SMTYP)

## **Programme objectives**

The status of small tuna stocks in the ICCAT Convention area is generally unknown. Nevertheless, these species have a high socio-economic relevance for a considerable number of local communities at the regional level, which depend on landings of these species for their livelihoods.

Fisheries statistics and biological data, which can provide a basis for assessing these resources and thus providing the Commission with appropriate scientific advice for their sustainable exploitation, are generally incomplete and not updated for these species.

The ICCAT Year Research Programme for Small Tunas (SMTYP) was adopted by the SCRS in 2011 and approved by ICCAT during its 2012 Annual meeting in Agadir (Morocco). The main objectives of the programme are the recovery of historical series of Task I and Task II data, collecting the available biological data, and conducting biological studies, mainly on growth and maturity for the main species of small tunas.

This programme has a wide geographical sampling coverage:

- Mediterranean and Black Sea: bullet tuna, Atlantic bonito, little tunny and plain bonito;
- West Africa: Atlantic bonito, little tunny, tuna, West African Spanish mackerel, frigate tuna, wahoo;
- Caribbean Sea and south-west Atlantic: blackfin tuna, king mackerel and serra Spanish mackerel and dolphinfish.

## 2017 Activities

The ICCAT Secretariat launched in February 2017 a Call for tenders with the aim to implement the main activities scheduled within SMTYP in 2017, in particular continuing the recovery of historical Task I and Task II data series and conducting growth and maturity studies for the main species. As a result, the Secretariat selected four scientific institutions and/or individual experts to carry out the tasks aforementioned (**Table 1**). However, the Secretariat only received signed contracts for two of those projects. The biological data collected covered mainly two geographical areas (North-east Atlantic and the Mediterranean Sea) and the following priority species (BON, LTA, FRI, BLT). Given the time constraints raised by many scientists last year, the deadline to submit the final draft report in 2017, was extended to 15 December, allowing scientists to extend longer their biological sampling period.

## Activities planned for 2018-2019

During the period 2018-2019, the Group plans to continue collecting biological samples for priority species as the first priority to further improve growth and maturity parameters estimates. The SMTYP programme aims also to launch genetic studies to improve the information on the stocks structure as a second priority.

Nevertheless, these objectives could not be achieved without a financial support from ICCAT. **Tables 2 and 3** give the detailed information on research activities to be conducted by species and research line and the corresponding estimated costs for 2018-2019.

# **2017 Expenditures**

The total expenditures within SMTYP during 2017 amounted to  $\in$  34,500. The detailed costs for each contracted institution are summarized in the **Table 1**.

# Budget for 2018-2019 and expected expenditures

To implement the main activities planned in the framework of SMTYP in 2018-2019, a total budget of  $\notin$ 210,000 is needed from ICCAT or other financial resources. The details of costs related to activities to be carried out in 2018-2019 are shown in the **Table 3**.

**Table 1.** The detailed expenditures within SMTYP during 2017.

Institution	Amount (€)
Samar Saber - Spain	12,000.00
IMROP - Mauritania	15,000.00
INDP – Cabo Verde	7,500.00
Total	34.500.00

# Report of the ICCAT Shark Research and Data Collection Programme (ICCAT/SRDCP)

## Background and programme objectives

During the 2014 Commission meeting it was decided that an overall budget of €135,000 would be allocated to the Shark Research and Data Collection Programme (SRDCP). During the 2015 Blue Shark Data Preparatory Meeting, the Shark Species Group (SSG) reviewed the proposal for implementation of the SRDCP that had been prepared in 2014 and identified National scientists who would be in charge of preparing proposals for receiving funds to carry out each of the research topics listed in the original proposal. For the first two years the programme focused on biological and other aspects of the shortfin mako and contemplated extensive collaborative work among National scientists with the aim of contributing information to the 2017 Shortfin Mako stock assessment.

## 2017 Activities

During the 2015 Blue Shark stock assessment meeting and shortly thereafter, four project proposals covering different aspects of the life history, stock structure, and fisheries of the shortfin mako were presented: a pan-Atlantic age and growth study; a population genetics study to estimate the stock structure and phylogeography of Atlantic shortfin mako; a post-release mortality study focusing on pelagic longline fisheries; and a satellite tagging study for determining movements and habitat use. A fifth project, to study the trophic relationships of Atlantic mako sharks through stable isotope analysis and possibly fatty acid analysis, was also presented later. Following are the cumulative SRDCP activities conducted up to 2017.

## Age and growth of shortfin mako in the Atlantic Ocean

The project leader for this study is Dr. Rui Coelho, National scientist from EU-Portugal, with participation of scientists from Portugal, Uruguay and United States. There still remain uncertainties about the age and growth parameters of shortfin mako and this project aimed to update the available estimates by ageing specimens from multiple areas in the Atlantic. To that end, an inventory of existing vertebral samples available at each national laboratory was compiled, and additional sampling was carried out. The current sample includes a total of 698 vertebrae: 253 from the northwest Atlantic, 103 from the northeast Atlantic, 268 from the southwest Atlantic, and 74 from the southeast Atlantic. All samples were processed and digital images were uploaded to an ICCAT online repository. Following a two-day age and growth workshop organized by NOAA-NEFSC (Narragansett Laboratory) with the participation of the involved scientists in June 2016 in which an initial reference set for ageing samples was established, one biologist from each participating institution read and estimated the ages from all the samples, based on the agreed ages from the reference set, and growth models were developed based on those readings. For the North Atlantic, data from 375 specimens ranging in size from 57 to 366 cm fork length (FL) for females and 52 to 279 cm FL for males were analyzed. Growth models were fitted using the von Bertalanffy growth equation re-parameterized to calculate L<sub>0</sub>, instead of t<sub>0</sub>, and a modification of this equation using the known size at birth. Growth models were compared using information theory criteria and the von Bertalanffy growth equation with fixed  $L_0$  (size at birth = 63 cm FL) adequately described model growth, with resulting growth parameters of Linf = 241.8 cm FL, k = 0.136 year<sup>-1</sup> for males and Linf = 350.3 cm FL, k = 0.064 year<sup>-1</sup> for females. The results of this study (SCRS/2017/111) were used in the 2017 Shortfin Mako stock assessment session.

# Genetic analysis of shortfin mako in the Atlantic Ocean

Dr. Yasuko Semba, National scientist from Japan took over as project leader for this study from Dr. Kotaro Yokawa. The main goal of this study was to investigate the genetic stock structure of the Atlantic shortfin mako using mitochondrial and microsatellite DNA of specimens collected across the entire Atlantic Ocean. The mitochondrial analyses conducted under this project indicated the differentiation of populations in the northern, southwestern, and southcentral and southeastern areas, which supports current stock structure hypotheses of Atlantic shortfin makos, and also suggested the possibility of multiple stocks within the South Atlantic; however, no significant genetic structuring was found based on the microsatellite analyses. Additional analyses to investigate the fine-scale genetic structure, especially in the North Atlantic, were conducted in 2017 based on tissues collected through collaboration with CPC members of the SSG from the entire Atlantic. Tissues from a total of 54 individuals were collected from the Caribbean Sea, Mediterranean, tropical Atlantic Ocean and Uruguay and were processed. Results of the new analyses confirmed previous findings and were reported more in detail at the SSG's meeting in September 2017 and in document SCRS/2017/214.

## Post-release mortality of shortfin mako in the Atlantic Ocean

The project leader for this study is Dr. Andrés Domingo, National scientist from Uruguay. The main purpose of this project is to quantify the post-release mortality of Atlantic shortfin makos on pelagic longlines, which is currently non-existent, to potentially contribute to their assessment and management. To that end, Survivorship Popup Satellite Archival Transmitting Tags (sPATs) were acquired and distributed to the participating laboratories for deployment in three main areas of the Atlantic: the northwest Atlantic, the tropical northeast Atlantic and equatorial region, and the southwest Atlantic. A total of 14 sPATs have been deployed thus far by scientific observers from IPMA (EU-Portugal), DINARA (Uruguay), and NOAA (USA) with 13 transmitting tags, and additional information from 8 miniPATs is also available to estimate post-release mortality. Of the 21 specimens with available information, six died (28.6%) whereas the remaining 15 (71.4%) survived, at least the first 30 days after tagging. The updated results from this project were reported and published in document SCRS/2017/050.

## Movements, stock boundaries and habitat use of shortfin mako in the Atlantic Ocean

The project leader for this study is Dr. Rui Coelho, National Scientist from EU-Portugal. The main purpose of this study is to use satellite telemetry to gather and provide information on stock boundaries, movement patterns and habitat use of shortfin mako in the Atlantic Ocean, to potentially contribute to their assessment and management. All phase 1 (2015-2016) tags (23 tags: 9 miniPATs and 14 sPATs) have been deployed by scientific observers on Portuguese, Uruguayan, and U.S. vessels in the temperate Northeast, temperate Northwest and Southwest Atlantic. Additionally, in late 2016, 12 additional miniPATs were acquired with the funds from 2016 for deployment in 2017, during the 2nd phase of the project. As one of the original miniPATs (2015) failed due to a depth sensor problem, the tag manufacturer provided one additional replacement tag. As such, for the 2nd phase of the project a total of 13 miniPATs are available for deployment in 2017. Additional tags from other projects (n=15) involving the same partners may also be deployed in these same areas, which cover both hemispheres and both sides of the Atlantic. A total of 747 tracking days have been recorded so far with ICCAT tags. The preliminary movement analysis shows that specimens tagged in the temperate northeast moved to southern areas, while specimens tagged in the tropical northeast region close to the Cabo Verde Archipelago moved easterly to the African continent shelf. One specimen was tagged in equatorial waters and moved south to Namibia. The specimens tagged in the southwest Atlantic off Uruguay stayed in the same general area, and the specimens tagged in the temperate Northwest Atlantic showed some general southward movements. The updated results from this project were reported and published in document SCRS/2017/050.

# Trophic relationships of shortfin mako in the Atlantic Ocean

The project leader for this study is Dr. Andrés Domingo, National scientist from Uruguay. The main purpose of this project was to characterize the trophic relationships of Atlantic shortfin makos using stable isotope analysis. Only a few tissue samples were collected to initiate the fatty acid and stable isotope projects in 2016 and 2017 and due to the difficulty in obtaining and shipping samples the project has been temporarily postponed until better logistic arrangements can be established.

# Life history (reproduction) of shortfin mako and porbeagle in the Atlantic Ocean

The project leader for this study is Dr. Enric Cortés. A two-day, hands-on training session on determination of reproductive maturity of porbeagle sharks was held at the Narragansett Rhode Island, NOAA Fisheries NEFSC Laboratory on 14-15 July 2017. During this training, scientists from the participating laboratories (SEFSC and NEFSC) worked together to collect reproductive organ samples to aid in determining reproductive habits and maturity for the species. The training was aimed at establishing standardized sampling practices among researchers for more consistent collection of life history data. Sampling took place at the New Bedford North Atlantic Monster Shark Tournament, in New

Bedford, Massachusetts, USA. Scientists met each day to gather sampling gear, travel to the tournament for sampling, and return to the laboratory with samples.

## 2018 Plan and Activities

## Age and growth of shortfin mako in the Atlantic Ocean

Most of the work for the North Atlantic shortfin mako has been finished and was used in the 2017 ICCAT Shortfin Mako assessment (presented in paper SCRS/2017/111). For the rest of 2017 and early 2018, the final age estimations for the South Atlantic will be completed. A peer-review paper is then expected to be produced and submitted during 2018 with the final results and conclusions of this project.

## Genetic analysis of shortfin mako in the Atlantic Ocean

Although most of the work in the project aimed at investigating the genetic stock structure of the shortfin mako using mitochondrial and microsatellite DNA has been completed (SCRS/2017/214), additional samples of specimens from the Mediterranean Sea are still required and will be obtained and analyzed.

# Post-release mortality of shortfin mako in the Atlantic Ocean / Movements, stock boundaries and habitat use of shortfin mako in the Atlantic Ocean

Tag deployment (phase 1) started in late 2015 and all tags were deployed during 2016. Updates of the project were presented at the 2016 ICCAT Shark Species Group intersessional and the 2017 Shortfin Mako data preparatory meetings (SCRS/2016/056, SCRS/2017/050). Phase 2 tags (miniPATS) were acquired in late 2016 and are being deployed in 2017, with the final analysis of this project expected during 2018.

# Life history (reproduction) of shortfin mako and porbeagle in the Atlantic Ocean

The next species to be assessed is scheduled to be porbeagle (POR) in 2019. There are currently large data gaps in the biological knowledge of this species, and as such it is important to continue projects on porbeagle so that the results can be available for the 2019 stock assessment. We therefore propose to continue work on the reproductive biology of this species in the western North Atlantic in 2018. Similarly, we also propose to continue work on the reproductive biology of the shortfin mako as this aspect of its life history remains particularly poorly understood. Therefore it is important to continue sampling of reproductive organs from both species. We also envisage conducting a workshop for reviewing and standardizing methods of analysis of reproductive data.

Additionally, even though the main ICCAT shark species are blue shark, shortfin mako and porbeagle, the SSG is also responsible for providing scientific advice on other pelagic, oceanic and highly migratory shark species that are caught in association with ICCAT fisheries. Most of these other species are data-limited, and as such it is a priority to start biological projects and data collection for these species in order to provide better advice in the future.

## Movements and habitat use of porbeagle in the Atlantic Ocean

The project leaders for this study are Dr. Andrés Domingo and Dr. Rui Coelho, National scientists from Uruguay and EU-Portugal. The main purpose of this study is to use satellite telemetry to gather and provide information on stock boundaries, movement patterns and habitat use of porbeagle in the Atlantic Ocean, to potentially contribute to their assessment and management. To that end miniPATs will be acquired and distributed to the participating laboratories for deployment by scientific observers from IPMA (EU-Portugal), DINARA (Uruguay), and NOAA (USA) in three main areas of the Atlantic: the northwest Atlantic, the tropical northeast Atlantic and equatorial region, and the southwest Atlantic.

## 2017 budget and expenditures

This section presents a summary of the contributions for the SRDCP during 2017. The Shark Species Group developed a budget of  $\notin$ 135,000 for Year 3 of the SRDCP that was subsequently reduced to  $\notin$ 75,000 (**Table 1**). Of these funds,  $\notin$ 17,000 was spent on the shortfin mako genetic analysis, reproductive study, and satellite time; the rest was to be used for purchasing satellite tags to be deployed on porbeagles.

# 2018 budget and requested contributions

The proposed budget for Year 4 of the SRDCP (2018) totals €100,000 (**Table 2**). Funds are being requested for research on porbeagle and shortfin mako, distributed as follows:

- Reproductive studies of porbeagle and shortfin mako, including sample collection and organizing a workshop to standardize sampling and analytical methodologies: €30,000
- Shortfin mako genetics (complete analysis with additional samples from the Mediterranean): €10,000
- Porbeagle:  $\in 60,000$  to purchase additional satellite tags for movement and habitat characterization studies

Total			135,000	75,000
Movements and habitat use (PSATs)	Uruguay, EU, US, etc.	Domingo	45,000	55,000

## **Appendix 8**

## **Report of the ICCAT Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP)** (Evidence based approach for sustainable management of tuna resources in the Atlantic)

## 1. AOTTP Year 1 and 2 Results and Activities

## 1.1 Background

The overall objective of AOTTP is to contribute to food security and economic growth of the Atlantic developing coastal states by ensuring sustainable management of tropical tuna resources in the Atlantic Ocean. The specific objective of this programme is to provide evidence based scientific advice to developing coastal states, and other Contracting Parties, to support the adoption of effective Conservation and Management Measures (CMMs) in the framework of ICCAT. This will be achieved through improving the estimation, derived from tag-recapture data, of key parameters for stock assessment analyses, i.e. growth, natural mortality, movements and stock structure, etc.

Note that all acronyms are expounded below (Addendum 1).

# 1.2 Budget

The total budget for the programme is 15 million Euros over five years of which the European Union contributes 90% and the rest is made up from voluntary contributions from the ICCAT CPCs and Cooperators. Since we reported last year 10 contracts have been negotiated and signed (**Table 1**) totaling just over 2 million Euros.

# 2. Tag-recapture and associated data from the three main tropical tuna and on neritic tuna species in the Atlantic are stored in a database at the ICCAT Secretariat

All the conventional tags needed for the entire AOTTP Programme have now been procured (*ca* 150,000 tags), including those needed for the tag-seeding experiments. Electronic tags for the first phase were procured by International Call for Tender. Desert Star and Wildlife Computers will supply AOTTP with 40 Seatag 3D and 95 Mini PAT-348C pop-up tags, respectively, while Lotek Wireless are providing 400 (LAT 2810) and 40 ARCGEO-9 internal tags. The 95 Wildlife Computers Mini PAT-348Cs, however, were found to have a technical problem in July 2016 and were recalled for repairs which has delayed their deployment. Desert Star tags had then to be deployed in their stead. During October 2016, however, a fault was noted in the Desert Star tags too which caused them to transmit corrupted data to the satellite and the remaining tags were called for replacement. The tags that were successfully deployed, but failed to report adequate data, will be replaced by Desert Star and analyses are ongoing. After a review of the performance of these tags during the first phase a decision will be made on future procurement.

# 2.1 Tagging of tropical tunas

Tagging activity began at the end of June 2016 in EU (Azores, Portugal), and then continued around the Canary Islands, and off West Africa and South Africa until April 2017. Tagging activities began in April 2017 in the territorial waters of Brazil and in Madeiran waters in July 2017. So far 57,514 tropical tuna across species and size-ranges have been tagged and released (e.g. **Figure 1** and **Table 2**).

Two-hundred and twenty-four have been released for a second time (R-2) and 2 for a third (R-3). The overall distribution between the three main tropical species is well-balanced with: BET at 27%; SKJ at 37%; and YFT at 34%. Two neritic species (LTA and WAH) are also being targeted by AOTTP. So far only 801 LTA and 23 WAH have been tagged against an overall target of 10,000. LTA is of particular interest to West African coastal communities and will be more actively sought for tagging during phase 2.

Twenty percent (24,000) of the 120,000 target are being double-tagged by AOTTP so that 'tag-shedding' rates can be estimated. Up to now 8,710 have been double-tagged, translating to 36% of the overall target, although the percentage varies among the species (**Table 3**) with, for example, 25% BET having been double-tagged, but only 13% SKJ. These imbalances will be redressed during Phase 2.

Size-ranges, or length-frequencies, of individuals tagged and released have been satisfactory overall so far (**Table 4**) although the very large BET and YFT have been difficult to catch, and there is much variability among locations and seasons. The failure to catch very large individuals is probably a function of the baitboat métier that is being used during AOTTP which typically catches smaller or mid-size individuals.

AOTTP is using a range of electronic tags to study the movements, and habitat preferences of tropical tuna: two different brands of pop-up type tag (Desert Star and Wildlife Computers) were bought; and one make of internal (Lotek).

As regards electronic tags, so far a total of 357 have been deployed, including: 24 Desert Star tags, 278 x Lotek internals, and 55 x Wildlife computer tags (**Table 5**). The pop-up tags were programmed (50:50 mix) to release after 90 days and 180 days. Retention times have been disappointing (see **Addendum 3**). For the Wildlife Computer tags mean retention times of 30 days have been recorded with a maximum of 94 days observed so far. Nevertheless useful data are being returned. Retention rates in South Africa, for example, have been relatively high and tracks showing the migrations of large yellowfin tuna between the Atlantic and Indian Ocean are emerging (**see Figure 2**).

Eleven boats have so far been used by AOTTP to tag fish in the eastern Atlantic: the Acoriana (Azores), the Grand Primero (Canary Islands) (**Figure 3**), the Macizo (Canary Islands), the Aita Fraxku (Senegal), the TarrynAmy (South Africa), the Estrela Delva (Brazil), the Katsushio Maru 8 (Brazil), The Thavisson III (Brazil), the Tubarão Tigre (Brazil), the Aldebaran I (Brazil), and the Ponta Calhau (Madeira).

Vessels deployed by AOTTP and partners have done 63 tagging cruises (**Addendum 2**) over the tropical Atlantic spending 609 days at sea, corresponding to 34% of the 1,800 day target (**Table 6**). Trained tagging teams have been deployed on all vessels and all the cruise reports detailing the activities, problems and recommendations are available from ICCAT.

# 2.2 Awareness Campaigns and Recovery Schemes

AOTTP has developed tag-recovery and awareness activities in all of the most important Atlantic Coastal States based on an initial analysis of tropical tuna landings by port. Awareness and publicity campaigns have now been designed and implemented in the following ten countries: Brazil, Senegal, Cabo Verde, Côte d'Ivoire, Ghana, Mauritania, EU-Portugal (Azores Islands), EU-Spain (Canary Islands), South Africa and Uruguay. Specific officers and staff have been selected in each location to develop and implement the activities (**Figures 4 to 6**). The awareness campaigns focus particularly on fishery stakeholders, but also include the general public. The design and production of the awareness-raising material reflects the specific idiosyncrasies of the fishermen, the crews of the commercial tuna vessels, the stevedores, traders, and fish processors.

# 2.3 Recovery of tags and transmission of data to ICCAT Secretariat

TROs have been set up in the most important tuna ports of the Atlantic. Contracts have been negotiated and signed with the following: Instituto Português do Mar (IMAR) of Portugal, IEO of Spain, CRODT of Senegal, CRO-CI of Côte d'Ivoire, INDP of Cabo Verde, FSSD in Ghana, Capmarine of South Africa, FADURPE Foundation in Brazil and CICMAR of Uruguay. Data are collected by the TROs, using the smartphone application developed by AOTTP, and quickly transmitted to the ICCAT Secretariat for verification and upload to the database (**Figure 7**).

Up to the end of this reporting period, the number of recoveries is 10,725 (**Figures 8 and 9**) translating to an overall recovery rate of *ca* 19% (**Table 7**).

Recoveries of the electronic, internal/archival tags have been relatively low with a pooled recovery rate of only *ca* 3% observed, although returns from bigeye have been higher (**Table 8**) than for yellowfin. One tag (ATP86659) was recovered in West Africa after being inside a fish for nearly 3 months (a 73cm YFT). After delivery to the ICCAT Secretariat a large data-set was successfully extracted (available at 15 second intervals) from this tag. A single month of data, aggregated by hour, is plotted in **Figure 10** which shows the pronounced diurnal vertical migration behavior of the fish during this period.

Nearly 5,000 fish have so far been tagged chemically by AOTTP (**Table 9**) which is done to help facilitate age-determination if the fish are recovered, and of these 752 have been recovered.

An Android based smartphone application, based on the Memento system, has been developed to collect and submit the data. Specific recovery templates in four languages (English, French, Spanish and Portuguese) facilitate fast and accurate upload of data to ICCAT (**Figure 7**). The system also enables ICCAT to rapidly deal with any issues/mistakes in the data. An important advantage is that it allows immediate feedback between the TRO, AOTTP, and the tag-finder so any questions or problems can be quickly and easily resolved (**Figure 6** – right panel).

Reporting rates are estimated by 'tag-seeding' experiments whereby 'false' tags are surreptitiously inserted into tuna at various points in the tuna value chain. Subsequently everything else remains the same (i.e. fishers, dockers find the tags, rewards are paid, and data sent to ICCAT) but it allows an estimate of the number of tags that might have been 'missed' between capture and market. The TROs are running the tag-seeding experiments in West Africa. Tag seeding experiments to estimate the reporting rates have been implemented in Côte d'Ivoire and Senegal which constitute 85% of the recoveries so far. AOTTP teams have placed 'false' tags in 110 fish. The overall reporting rate is 67% but this varies substantially among the three species and the location at which the tag-seeding experiment was done.

Another important statistic in estimating population size from large-scale fish tagging programmes is the 'tag-shedding rate'. The number of tags shed after tagging can be estimated for all areas and species since *ca* 20% of the tuna released are double-tagged. So far 1972 of the recovered, tagged tuna were double tagged (**Figure 11**). Tag-shedding rates for the four species with recovery data are summarized in **Table 10**. Overall rates are ca 4%.

# **3.** Key parameters supporting stock assessments are estimated on the basis of data collected through the programme and integrated in stock assessments

One key objective of the AOTTP is to help reduce the risk of failing to meet ICCAT management objectives for the main tropical tuna stocks, i.e. that  $B/B_{MSY}$  is kept above 1 and  $F/F_{MSY}$  below 1. To do this requires robust scientific advice, specifically to reduce the uncertainty in estimates of stock status with respect to reference points and to increase the effectiveness of management measures based on total allowable catches (TACs), harvest control rules (HCRs) and spatial management measures. The AOTTP is, therefore, collaborating with other SCRS and t-RFMO working groups in order to determine the best tagging and data collection protocols to ensure that ICCAT management objectives can be met in a cost effective way.

AOTTP is focusing on only two coastal small tuna species: wahoo and little tunny. As of writing 801 and 23 little tunny and wahoo have been tagged, respectively, with 165 recoveries of little tunny (**Tables 1 and 3**). During the second phase tagging AOTTP will, therefore, target neritic tunas more specifically, building on the numbers tagged during Phase 1.

# 3.1 Reading of hard parts

During the AOTTP programme 10,000 fish are being targeted for 'chemical tags', i.e. they are injected with a chemical marker that allows their otoliths (or other hard parts) to be 'read', and aged more easily. Chemically tagged fish always carry red spaghetti tags (**Figure 12**), marked with 'KEEP WHOLE FISH'. When a fish with a red tag is reported, TROs arrange to buy the fish, pay any reward etc., take, store and process the biological samples, and ultimately determine the age of the fish from the hard-parts. AOTTP TROs have already purchased and taken biological samples from 387 chemically marked fish (red tags) representing all size classes, the three species, and both genders (**Table 11**). Other biological information like body-weight, state of sexual maturity, and stomach contents complement the analyses. The samples have all been properly processed, stored, and preserved in the laboratory facilities of the project counterparts.

An Otolith Expert Group with specialists from Australia, Cote d'Ivoire, EU-France, EU-Spain, Senegal, South Africa and USA, was set up by AOTTP with the ICCAT SCRS approval. The specific aim was to establish the procedures and protocols for the collection, preservation and reading of otoliths. A formal workshop was then organized at the CRO-CI (Abidjan) on 1-2 March 2017 to initiate the activities, and to facilitate previous exchanges of ideas and discussions (**Figure 13**). The Otolith Expert Group recommended creating a

Reference Collection of Otoliths to orientate and 'calibrate' age-readings. A Call for Tender to create the Reference Collection was thus launched and two contracts will be awarded soon, covering the tropical Atlantic Ocean, and ensuring cooperative and coordinated work.

# 3.2 Tagging data analyses

As discussed above AOTTP has already generated a large dataset comprising: (i) mark-recapture data from spaghetti tags; (ii) tag seeding data; (iii) data from electronic tags; and, (iv) biological samples such as otoliths. The AOTTP data and publication policy has been discussed and submitted to the SCRS. The data analysis will be mostly developed within the framework of the SCRS. See also Revised Log-frame and Updated Action Plan sections below for more details.

## 3.3 Information from stakeholders

This activity relates to the organization of the Symposium planned for the final months of the AOTTP project, i.e. between April and June 2020. Plans for this work are outlined, and discussed in the Revised Log-Frame and Updated Action Plan sections.

# 4. Scientists from developing country Contracting Parties of ICCAT are trained in tagging, data collection, and tagging data/stock assessment analysis

At least 20 scientists/technicians from developing countries have already been trained in tagging techniques at sea, including two from Cabo Verde, seven from Côte d'Ivoire, seven from Ghana, five from Senegal, and eight from Brazil. In addition, all TROs, and their supporting teams, has received training in the AOTTP protocols for collecting tag-recovery information. This includes procedures for introducing data into the recovery template of the AOTTP smartphone application, the subsequent submission of data to AOTTP, and the resolution of any problems via the AOTTP recovery Telegram group (**Figures 14 and 15**). Additional information is provided in section 8.4 and 8.5.

# 4.1 Training in tagging techniques and data collection

The first tagging phase in the eastern Atlantic (Azores, Canary Islands, and West Africa) was contracted to a Consortium led by AZTI (*http://www.azti.es/*). All the AZTI Consortium partners (CRO-CI, IEO, CRODT, IMAR and FSSD) supplied personnel for the tagging teams on board the chartered vessels. At least 46 individuals (from Senegal, Cabo Verde, Côte d'Ivoire, EU-France, EU-Portugal, EU-Spain, USA (Hawaii), São Tomé and Principe, and Ghana) attended training courses run by AZTI in conventional, chemical and electronic tagging, and associated data collection (**Figure 16**).

The number of scientists from African institutes who were trained and took part in the tagging activities organized by AZTI were as follows:

- Senegal (CRODT consortium member): 5 persons trained, of which 4 took part in tagging
- Côte d'Ivoire (CRO-CI consortium member): 7 persons trained, of which 4 took part in tagging
- Ghana (FSSD consortium member): 2 persons trained directly and 4 indirectly, 3 took part in tagging
- Cabo Verde (INDP subcontracted by AZTI): 1 person trained who also took part in tagging
- São Tomé and Principe (Fisheries Direction requested to take part): 1 person trained who also took part in tagging

Numbers of fish tagged during the AOTTP programme by scientists from developing countries is summarized in **Table 12**, showing that over half (56%) have been tagged by latter scientists/technicians.

# 4.2 Data collection and sampling at recovery

Tag recovery and awareness-raising activities have been set up in the following ten countries: Brazil, EU-Portugal (Azores Islands), EU-Spain (Canary Islands), Cabo Verde, Cote d'Ivoire, Ghana, Mauritania, Senegal, South Africa and Uruguay (**Figure 3**). The AOTTP Publicity and Tag Recovery Officer has visited the Azores twice where training in data collection and sampling at recovery has been provided. Training has also been provided to the TROs in Abidjan, Dakar and Ghana.

### 4.3 Training in data analysis

As mentioned above this activity will start earlier than was planned in the original AOTTP Grant Contract. After the data have been approved for study AOTTP will organize activities such as study visits and/or working groups. Additional information provided in section 8.5.

### 5. Beneficiaries

The AOTTP Action Team, together with the ICCAT Secretariat, maintains good relationships with the State Authorities in the target countries. AOTTP is working directly with State Authorities in Brazil, Cabo Verde, Côte d'Ivoire, EU-Spain and Portugal, Ghana, Guinea-Bissau, Mauritania, São Tomé e Príncipe, Senegal, and South Africa, Uruguay, USA. AOTTP contractors are in regular contact with the government departments etc. in order to get the work done. Note also that, during the tagging campaigns in West Africa, permission was granted to AOTTP contractors to catch bait, and tag tuna in the territorial waters of 15 countries (**Table 13**), including one that is not an ICCAT Contracting Party (Benin), demonstrating the interest in, and support for, the project. Having government representatives on board the tagging vessel in West Africa was also often a condition for gaining access to territorial waters for tagging, e.g. Guinea-Bissau, Mauritania, and São Tomé & Príncipe. For these three countries the following individuals came on board the tagging vessel:

- Ahmed DIAGNE (IMROP, Mauritania) in the 2nd trip zone A, as observer;
- Mario Abel NBUNDE (CIPA, Guinea Bissau) in the 3rd trip of zone A, as observer;
- Mirian GOMES CRAVID (Fisheries Department, São Tomé & Príncipe) in the 4th trip of zone B, as tagger.

The relationship between AOTTP and DAFF in South Africa has strengthened due to the tagging programme.

ICCAT CPCs and Cooperators have also contributed funds to the AOTTP programme, including the People's Republic of China, USA, Canada, and Chinese Taipei. The Uruguayan Research Vessel was also made available to AOTTP without charge to tag tuna.

During Year 2 AOTTP worked with the AZTI Consortium for tagging activities in the Azores, the Canary Islands, and West Africa. AZTI subcontracted CRO-CI, CRODT, FSSD, IEO, IMAR, and MFRD/FSSD. In awareness-raising and tag-recovery activities AOTTP is also working directly, and successfully, with many of the same organizations (e.g. CRO-CI, CRODT, MFRD/FSSD, IEO, and IMAR) but also with Capmarine and INDP (Cabo Verde). In other areas of the Atlantic we are working, or have worked, with the FADURPE Consortium (Brazil), LPRC (USA), and Capmarine (South Africa) to tag fish at sea. A contract was also signed in early 2017 with PROBITEC (Spain) to tag fish the EEZ of Venezuela; however due to a number of issues work has not yet started and alternatives in the region are currently being assessed.

Since inception AOTTP has worked with the skippers and crews of eleven commercial fishing vessels and feedback with respect to the relationships between the scientific and technical teams and the fishing crews has been routinely positive, according to the cruise reports where this is often described. The fishers are usually extremely engaged, enthusiastic about the tagging work, and delighted to help in all possible ways.

The otolith workshop in March 2016 was supported by Capmarine (South Africa), CSIRO (Australia), and SPC (New Caledonia) who generously allowed their expert staff (Stewart Norman, Jessica Farley, and Bruno Leroy) to attend the workshop in Abidjan, traveling considerable distances.

AOTTP has an agreement with IATTC to pay rewards on its behalf and collect metadata from tags where possible. The TROs in Abidjan work closely with personnel from IRD and IEO to gain access to log-book data essential for ascertaining where and when a tagged tuna was actually caught.

The SCRS and its scientists, including those from developing states, are enthusiastic about AOTTP and the data being collected. When analyses begin at the end of 2017 SCRS scientists will benefit from training, coaching, and mentoring provided by AOTTP and the ICCAT Secretariat. The fisheries authorities in many ICCAT CPCs are aware of the project and three of their staff (see above) have directly benefited through trips on board the tagging vessels and the training. The ICCAT scientific community will also benefit by having a highly useful dataset for informing policy, the efficacy of management measures (e.g. spatial closures) all resulting in better management of the fisheries in ICCAT's mandate.

### 6. Visibility

The EU logo and ICCAT logos, with funding statement, are always clearly visible on all communication materials including flyers, pamphlets, posters, reports, newsletters, t-shirts, and caps). The materials can be seen at harbors, at fishing beaches, and on board fishing and recreational vessels throughout AOTTP target countries. AOTTP has been formally presented at many different fora around the Atlantic Coastal States, including:

- Meeting of the ICCAT on stock assessment methods (Doug Beare, Madrid, 19 February 2016)
- ICCAT yellowfin data preparatory meeting (Doug Beare, Pasaia, 11 March 2016)
- ICCAT small tunas species group intersessional meeting (Doug Beare, Madrid, 6 April 2016)
- ICCAT SCRS Plenary (Doug Beare, Madrid, 24 September 2016)
- Fisheries Forum (Pedro Guemes, Azores, 6 July 2016)
- AOTTP summary presentation (Doug Beare, Universidade Veiga de Almeida, Brazil, 3 April 2017)
- AOTTP summary presentation (Doug Beare, Recife, 5 April 2017)
- AOTTP summary presentation (Miguel Neves dos Santos, Doug Beare, Brussels, 19 June 2017, http://ec.europa.eu/europeaid/news-and-events/atlantic-ocean-tropical-tuna-tagging-programmeaottp\_en)
- AOTTP summary presentation on Small Tunas (Miguel Santos, Miami, 27 April 2017)

### AOTTP has already been published widely on the internet, e.g.:

The AOTTP Youtube channel with training tutorials etc., can be found here:

• https://www.youtube.com/channel/UClCXmfvKvmxqeZMU4LFa\_hQ

A video on tagging off Senegal made by our partners, AZTI, can be found here:

https://www.youtube.com/watch?v=l9lzrqMI0lo&t=1s

News and updates have been produced regularly for the AOTTP Steering Groups, and the TROs. Newsletters for DG-DEVCO will also be produced quarterly and the first edition is now available from ICCAT.

### 7. Revised Logical Framework

Identifying how knowledge gained under AOTTP can reduce uncertainty is one of the key outcomes of the project, and can also be thought of as, 'the Value of Information'. The clarification of 'End Targets', together with a clear work plan, will help ICCAT/AOTTP and DG-DEVCO achieve its objectives. We, therefore, propose to insert the following End Target for all three tropical species (**see Table 14**) in the AOTTP Logical-framework Matrix:

• Reduce 'cloud' of uncertainty around the Kobe phase plot for a single type of assessment model.

If the uncertainty can be reduced in a meaningful way it means that the stocks can be managed closer to Commission objectives. Please note, however, that it is difficult to specify the exact amount by which the uncertainty can be reduced as there are 'subjective' factors which cannot be quantified.

### 8. Updated Action Plan

### 8.1 Overall

The project started about six months late due to administrative issues but we are catching up. Activities A1.1, A1.2, A1.3, A2.1, A3.1, and A3.2 (**Table 15**) started more or less on schedule and are all now progressing well. The exceptions are A1.1 and A1.3 because tagging activities (and therefore recovery) did not start until Quarter 3, 2016.

### 8.2 Tagging at sea

For Phase 1 the target was set at 72,500. Tagging began in the Azores at the end of June this year (2,775 tagged, target 4,500) and followed in a clockwise direction around the Atlantic with tagging taking place in the Canary Islands (6,526 tagged, target = 6,500), Mauritania-Guinea Rep. (11,237 tagged, target = 11,000), Gulf of Guinea (26,829 tagged, target = 22,000), and South Africa (218, target = 6,500) until the end of April 2017.

Tagging started in Brazil and Uruguay (*ca* 8,000 tagged, target = 13,000) in April 2017 and is continuing. During 2017, 20 fish will also be fitted with pop-ups in the territorial waters of USA. In February ICCAT signed a contract to tag 9,000 fish in the territorial waters of Venezuela as part of the Phase 1 targets. Unfortunately, however, substantial delays and uncertainty related to this contract raised the need to consider alternatives.

Calls for Tender for Phase 2 tagging in all areas are in preparation, but the final distribution of tags by location and time is being discussed by the AOTTP Steering Committee.

### 8.3 Tag recovery and awareness raising

AOTTP coordination in Madrid will seek feedback from the TROs and discuss what is working, what is not, and consider strategies for the future. AOTTP will now expand activities into CPCs, areas and fleets which are not yet formally involved in the programme. This work will predominantly target awareness-raising and possibly tagging (by observers) among the longline fleet (mostly Asian, but also North American) which operates in more central areas of the Atlantic Ocean.

### 8.4. AOTTP research and data analysis

Research will be driven by the priorities of the ICCAT SCRS and Commission. All work will be integrated within ICCAT/SCRS's annual cycle of Working Groups according to ICCAT's Management Framework. Detailed planning will, therefore, have to be adjusted according to the requirements of the SCRS and ICCAT Commission, which can and will eventually change throughout the programme life span. The annual cycle of work can, however, be broadly articulated as follows:

- 1. AOTTP will keep collecting the tag-recovery data, check and validate them, pay rewards, and store them in a relational database at ICCAT (**Figure 17**).
- 2. AOTTP will present basic summary statistics (tag release and recovery frequencies, tag-shedding rates, times at liberty and reporting rates) from the tag-recapture database to the relevant SCRS Working Groups each year (in 2017 the Tropical Species Group Intersessional Meeting (4-8 September) and at the SCRS Plenary between (2-6 October)).
- 3. Based on these statistics, and other information, the SCRS will take decisions on research, management and capacity building priorities within their annual work plans.
- 4. Once plans are approved by the Commission research activities will be organized by AOTTP (**Table 16**). These may require that Calls for Tender be launched.

### 8.5 AOTTP capacity building

Scientists and technicians, particularly from ICCAT developing Contracting Parties have already been trained in all aspects of tagging at sea, tag recovery and awareness raising activities. Now that a rich dataset is beginning to accumulate, training and capacity development in all aspects of tagging data analyses, biological parameter calculation, and their eventual incorporation into population assessment models must be planned. This work was not scheduled to start until Quarter 4 2018 in the original AOTTP Grant Contract agreement with DG-DEVCO. However, AOTTP Coordination and the SCRS, believe that by then it will be too late for a successful Final Symposium and proposes instead to arrange four study visits/workshops during the next reporting period (September 2017 to September 2018); two in Q4 2017; one in Q1 2018 and one in Q2 2018 (**Table 16**). These will be based on the 'model' successfully used when the Otolith Expert Working Group was organized in March 2017, or adapted as necessary. This involved inviting recognized global experts to a meeting, organized by colleagues in Abidjan, at which their experience and knowledge was shared with the local scientists. Note that the experts invited gave up their time free of charge to engage with the project.

The priority of AOTTP is to reduce uncertainty in population assessments of tropical tuna by improving understanding of growth, mortality and movements. However, such biological parameter estimations will take time and work to confirm, and capacity building activities will need to start slowly and methodically at the level of understanding the raw data, the database, and how to plot and model them etc. using popular software (e.g. R, Excel, RStudio, QGIS, PostgreSQL).

AOTTP proposes, therefore, to organize a series of workshops - beginning in Madrid during late 2017 - to promote the involvement of ICCAT CPs in the analysis, and scientific interpretation, of AOTTP tagging data. The workshops will be part of a continuous programme of capacity development which will also include funding of MSc and PhD students from developing country CPs for which proposals will be sought. Depending on demand, the workshops will initially be done in both English and French. Participants will be selected according to a minimum level experience and the overall need for developing and improving regional capacity among fisheries managers.

The workshops will be supported by the ICCAT SCRS, and the AOTTP Steering Committee who will help formulate the material to be covered. Representatives of these committees may also be invited to the workshops to guide activities and discussions.

The workshops will be aimed at scientists actively involved in provision of fisheries management advice. The four workshops to be organized within the following reporting period will focus on the themes listed below. Recognized experts in each work/research sub-component will be invited to lead activities and discussions. The following workshops may include fisheries science theory and worked examples:

- AOTTP relational database improved understanding of relational database and data structures, increasing capacity to work with AOTTP in the development of the mark-recapture databases, increased ability to connect with the remote databases using plotting and statistical software (R, QGIS, Excel);
- Tropical tuna growth (analyses of growth rates, fitting non-linear models);
- Mortality and selectivity (estimating natural mortality and gear selectivity);
- Species movements (quantifying distance traveled, 'stock mixing coefficients' etc.).

### Addendum 1

# List of acronyms

AOTTP	Atlantic Ocean Tropical tuna Tagging Programme
AZTI	Centro Tecnológico experto en innovación marina y alimentaria
BET	Bigeye tuna (Thunnus obesus)
CICMAR	Centro de Investigación y Conservación Marina
CIPA	Research Centres. Centro de Investigacao Pesqueira Aplicada (CIPA) de Bisseau
CLPA	Comité Local de la Pêche Artisanale (Sénégal)
СММ	Conservation and Management Measures
ССР	Contracting Parties (ICCAT)
CRO – CI	Centre Recherches Océanologiques (Côte d'Ivoire)
CRODT	Centre Recherches Océanologiques de Dakar (Sénégal)
CSIRO	Commonwealth Scientific and Industrial Research Organization (Australia)
DAFF	Department of Agriculture, Forestry and Fisheries (South Africa)
DEPAq	Departamento de Pesca e Aquicultura (Brazil)
DG-DEVCO	Directorate-General for International Cooperation and Development
DG-MARE	Directorate-General for Maritime Affairs and Fisheries
EEZ	Exclusive Economic Zone
FADURPE	Fundaçao Apolonio Salles de Desenvolvimento Educacional
FSSD	Fisheries Scientific Survey Division (Ghana)
FM	Fausses marques
IATTC	Inter-American Tropical Tuna Commission (USA)
ICCAT	International Commission for the Conservation of Atlantic Tunas
IEO	Instituto Español de Oceanografía
IMAR	Instituto do Mar
IMROP	Institute Mauritanien de Recherches Oceanographiques et des Pêches (Sao Tomé & Príncipe
INDP	Instituto Nacional para Desenvolvimento das Pescas (Cabo Verde)
IRD	Institute de recherche pour le development
ISRA	Institute Senegalais de Recherches Agricoles
LATEP	Laboratorio de Tecnologia Pesqueira (Brazil)
LPRC	Large Pelagic Research Center (USA)
LTA	Little tunny ( <i>Euthynnus alletteratus</i> )
MFRD	Marine Fisheries Research Division (Ghana)
MFV	Motor Fishing Vessel
MSE	Management Strategy Evaluation
PAD	Port Autonome de Dakar (Senegal)
PROBITEC	Proyectos Biológicos y Técnicos (Spain)
RV	Research Vessel
SC	Steering Committee
SCRS	Standing Committee on Research and Statistics
SKJ	Skipjack tuna ( <i>Katsuwonus pelamis</i> )

SPC	Pacific Community (New Caledonia)
tRFMO	Tuna Regional Fisheries Management Organizations
TRO	Tag Recovery Officer
UPV	Universidad Politécnica de Valencia (Spain)
UFERSA	Universidade Federal Rural de Semiarido (Brazil)
UFPRE	Universidade Federal de Pernambuco (Brazil)
UPV	Universidad Politécnica de Valencia (Spain)
YFT	Yellowfin tuna (Thunnus albacares)

Appendix 9

# 2017 Report of the Sub-Committee on Statistics

(ICCAT Secretariat, 25-26 September 2017)

### 1. Opening, adoption of Agenda and meeting arrangements.

The Sub-committee on Statistics met at the ICCAT Secretariat (Madrid, Spain) on 25-26 September 2017. The ICCAT Assistant Executive Secretary, Dr. Miguel Neves Dos Santos welcomed the Sub-committee and highlighted the importance of its work and the commitment of the Secretariat to support the work of SCRS and the Commission. The meeting was chaired by Dr. Guillermo Diaz (USA). The Agenda was discussed and adopted without any modifications.

### 2. Review of fisheries and biological data submitted during 2017

The Secretariat presented information contained in the 2017 Secretariat Report on Statistics and Coordination of Research (SCI-008) related to fisheries and biological data submitted for 2016 including revisions to historical data.

The activities and information included in this report refer to the period between 1 December 2016 and 12 September 2017 (the reporting period). All the basic fisheries, and biological statistics have been presented by the Secretariat to the SCRS Working Groups during SCRS inter-sessional meetings. The Secretariat continues to note the improvements in terms of data submission using the ICCAT electronic forms. Regarding the activities conducted by the Secretariat, in the most recent years, in addition to the normal activities developed on statistics, publications, data funds management and others, the Secretariat is dedicating (apart from the usual preparation of the majority of the datasets required by each assessment) a lot of additional work to stock assessment activities, whether participating actively in the assessment or coordinating and managing external support to the SCRS work. In addition, the statistical work requested to the Secretariat in the last five years, together with some lack of adherence to deadlines established for data submission, continues to constitute an enormous amount of work for the Secretariat, which is not sustainable.

The Secretariat applied, to the 2016 datasets reported, the SCRS filtering criteria to accept/reject statistical forms (2013 Report of the Sub-committee on Statistics, Addendum 2 to Appendix 8, Filters 1 & 2) adopted in 2013. The results are based on a total of 74 flags (from 51 CP's & 5 NCC's: 49 CP's + 16 EU members + 4 UK-OT members + 5 NCCs) with possibly reporting obligations. The forms submitted with errors that the Secretariat was unable to correct were considered unreported data.

### 2.1 Basic Task I (T1FC and T1NC) and Task II (T2CE and T2SZ) statistics

The Secretariat presented the 2016 data reporting status (**Table 1 and 2** of SCI-008) of the two datasets of Task I statistics (T1FC: fleet characteristics; T1NC: nominal catches). The Secretariat reminded the Sub-committee of the new structure of the T1FC electronic form (ST01) used to collect information on individual vessels (sub-form ST01A) and summarized information for vessels less than 20 m LOA (sub-form ST01B). The overall reporting of ST01 increased slightly from 68% in 2016 to 72% in 2017 (53 flags). Six flags reported after the submission deadline. The Secretariat made corrections to the data reported by 2 flags, and 13 invalid forms are waiting a complete revision by CPCs.

The T1NC (nominal catches) dataset was presented for the major ICCAT species (major tunas, major sharks, 13 species of small tunas and dolphin fish). The Secretariat also reminded the Sub-committee that the ST02-T1NC electronic form has 2 subforms: ST02A used to report positive catches (landings, dead discards, and live releases) and ST02B used to report "zero" catches. The T1NC 2016 report card is presented in Table 2 of SCI-008. Like the T1FC reporting, 2016 reports showed a slight increase in reporting (63 flags corresponding to 85%) compared to 2015 (80%). Five flags reported late and the Secretariat made corrections to 9 datasets. Eleven CPCs (15%) have yet to report their T1NC data.

As part of the T1NC data review, the Sub-committee also requested information on the reports of dead discards and live releases. Table 1 shows the number of CPCs that have provided this information by year (period 2014-2016) and by main species. The results clearly show that CPCs are not complying with their obligation to report dead discards and live releases. The Sub-committee reiterates that this information is essential for stock assessment purposes and that CPCs that do not provide estimates of discards are in lack of compliance with ICCAT's data submission requirements.

**Table 1.** Number of CPCs that reported dead discards and live releases for years 2014-2016.

The T2CE (catch and effort) report card is presented in Table 3 of SCI-008. A total of 56 flags (76%), including 7 late reporting-flags, reported T2CE. This represents a significant increase in T2CE reporting compared to 2015 (64% reporting). Eighteen flag CPCs have yet to report T2CE data.

The Secretariat presented the Task II size data (combining T2CS and T2SZ) card report in Table 4 of SCI-008. The 2016 submission of size also showed a significant increase in reporting. A total of 52 flag CPCs (70%), including 5 late reports, submitted 2016 size data compared to 36 flags (46%) for 2015. Some of the submitted data are pending review and corrections by the Secretariat. A total of 22 CPCs have yet to submit 2016 size data.

### 2.2 Tagging

The different laboratories and scientific institutions conducting electronic tagging in the ICCAT Convention area reported a total of 153 releases and 85 recoveries made in late 2015 and during 2016. With respect to conventional tagging, a total of 827 were tagged and 339 tags were recovered during the same period. From September 2015 to September 2016, the Secretariat distributed about 3,400 conventional tags. These figures do not include any tags deployed and recovered by the AOTTP.

# 2.3 Complementary data obtained within ICCAT data collection and research programs (GBYP, AOTTP, EPBR, SMTYP and SRDCP)

The GBYP presented 3 documents SCRS/2017/191, SCRS/2017/192, and SCRS/2017/208. Document SCRS/2017/191 presented the results of data recovery efforts during the first part of Phase 7 of the Atlantic-Wide Bluefin Tuna Research Programme (ICCAT GBYP). The data recovery efforts resulted in incorporating historical data on trap fisheries and recent data from longline fisheries. These data have been reviewed and approved by the bluefin tuna Working Group and have already been included as part of the ICCAT database.

Document SCRS/2017/192 described a newly developed relational database for bluefin tuna electronic tags. It was explained that the system is still on a testing phase. The Sub-committee found the developed application to be a very useful tool. It was also explained that the application can be used in individual computers to use on other tagging datasets.

Document SCRS/2017/208 presented the results of the use of the Research Mortality Allowance (RMA) for the period 2012 to September 2017. The used RMA during that period ranged from 0.3 t to 5 t.

Progress on AOTTP was summarized by the Programme Coordinator. Activities leading to the development of the tag and release database were described, and the contents of that database summarized. Since AOTTP began tagging off the Azores in June 2016 more than 600 days at sea have been spent on more than 60 tagging cruises throughout the Atlantic. Nearly 60,000 fish have been tagged with conventional tags in the EEZs of 15 different countries, in addition to the High Seas. More than 8,000 fish have been double-tagged allowing tag-shedding rates to be estimated, while around 4,500 have been marked chemically to improve subsequent ageing of recovered fish. More than 300 electronic tags (pop-ups and internals) have been deployed. Tag-recovery and awareness raising infrastructures have been set up in ten countries, and more than 10,000 conventional tags have been recovered (ca 20% recovery rate) for which rewards have been paid. Posters, t-shirts, and caps, as rewards to incentivize tag-recovery, have been designed in four languages. More than 200 fish have been purchased and samples taken for determination of age, sex and state of sexual maturity. Relational databases and smartphone applications for populating them have been designed, developed and implemented. More than 60 colleagues from developing countries have been trained in all aspects of tagging at sea, tag-recovery, and data transmission methodologies. AOTTP coordination is working with ICCAT SCRS to build scientific capacity among ICCAT CPCs to make effective use of the tagging data for improving the tropical tuna stock assessments.

### 2.4 Other relevant statistics (observer data, VMS, BCDs, ISSF, etc.)

The Secretariat indicated that for 2016 only 11 CPCs reported observer data using the ST09 form. The Secretariat also summarized the reported data on seabirds and sea turtles which are extremely limited and sparse. As has already been recognized by the Sub-committee on Ecosystems, this Sub-committee once again reminds CPCs of their obligations to report by-catch data collected by their observer programmes. The limited available data so far has precluded the SCRS to advance the assessment of the efficacy of seabird mitigation measures as required by Rec. 11-09. For the same reason, the assessment of the impact of ICCAT fisheries on sea turtles in the Convention area has also suffered delays and it has been limited to only one gear type.

The Sub-committee reiterated the utility of VMS data for assessing fishing activity in the Atlantic Ocean. It was noted that the ICCAT Ad Hoc Working Group on FADs had also stressed the need to access VMS data in order to better characterize fishing effort of purse seiners and therefore improve the corresponding CPUE indices. The Sub-committee noted that scientists should have access to this data to improve their analyses.

The Secretariat indicated that the data that has been provided by the ISSF are not in a standardized format and, therefore, they can't be easily included into the ICCAT database. The Secretariat and the ISSF will work together to solve this pending issue.

### 3. Review of Secretariat's standard (yearly based) datasets estimations

### 3.1 CATDIS and EFFDIS

The Secretariat continued to improve the detailed level of the CATDIS. The last update was presented in June 2017 for the nine major species which included some historical T2CE series. These results were published in the Statistical Bulletin series (Vol. 43(2), at: <a href="https://www.iccat.int/sbull/SB43-2-2017/index.html">www.iccat.int/sbull/SB43-2-2017/index.html</a> ) of ICCAT.

In early 2017, the Sub-committee on Ecosystems requested that EFFDIS be updated given some general updates in the Task I and II data (particularly from JPN). The revised and updated EFFDIS was presented by the Secretariat in SCRS/P/2017/032. The SCRS reviewed the new EFFDIS and found some problems with the estimation and the nomenclature that were later fixed by the Secretariat. The newly revised EFFDIS was used by the Sub-committee on Ecosystems to estimate the total number of sea turtle interactions with longline gear in the ICCAT convention area. It was discussed that further improvements to the EFFDIS can be obtained by CPCs revising and improving their historical series of T2CE.

### 3.2 CAS (catch-at-size) and CAA (catch-at-age)

The Secretariat informed the Sub-committee that the CAS database is now complete and functional and it has an active connection between the size data and the substitution tables used for the CAS estimations. As required, the Secretariat also provided updated CAS and CAA matrices for the 2017 swordfish and bluefin tuna stock assessments.

### 4. Evaluation of data deficiencies pursuant to Rec. 05-09

### 4.1 2016 Report Cards applying SCRS validation criteria (Filters 1 and 2)

The Secretariat applied, for the fourth consecutive year, the SCRS filtering criteria (Filter 1 and 2, described in Addendum 2 to Appendix 8 of 2013 SCRS report, updated by the SCRS in 2016) to validate and accept Task I (form ST01 and ST02) and Task II (forms ST03, ST04 and ST05) statistics received under those official forms. The filtering criteria are also embedded (most updated SCRS version) in each one of these forms.

For 2016 data, Filter 1 was effectively applied and the results are presented in the SCRS Report Cards (**Tables 1**, **2**, **3**, **4**, and **5** of SCI-008, with a summary in **Figure 1** of SCI-008). The "orange" cells indicate the datasets that have not passed Filter 1. However, the majority of the Task I forms rejected, were afterwards corrected by the Secretariat and provisionally (marked for revision) integrated into the ICCAT database system (ICCAT-DB). Task II forms not passing Filter 1 were not corrected (left for posterior revisions with the respective CPCs). Filter 2 was used for testing purposes and the results presented to the SCRS. Both filters were used on every Task I and Task II dataset received (scenario 2, methodology described in Palma and Gallego, 2015<sup>1</sup>).

Over these last four years, the Sub-committee have observed continuous improvements in the level of reporting (CPCs reporting ratios), in the reduction of "late-reporting", and also some progress in the level of completeness of the forms (less errors) and level of detail of some information (in particular Task II). This tool has proven, during its short living, to be very effective in imposing strict reporting obligations and minimum data quality standards that will benefit the work of ICCAT in the future.

### 4.2 Standard catalogues of major ICCAT species (1990-2016)

The Secretariat presented in Appendix 1 of document SCI-008, the Task I/Task II data SCRS catalogues for the major ICCAT species (1996 to 2016). These catalogues, also available for small tunas, were published in the 2017 small tuna intersessional meeting scientific report. The Sub-committee acknowledged improvements in data submissions. However, major deficiencies still exist for some ICCAT stocks, particularly for the historical data. Once again, the Sub-committee agreed that this information should be reviewed by the species groups, in particular by those that are scheduled to conduct stock assessments in 2018.

<sup>&</sup>lt;sup>1</sup> Palma C. and Gallego J.L. 2015. Results of applying Filters 1 and 2 to the 2013 statistical data reported during 2014. ICCAT Col. Vol. Sci. Pap. 71(6): 3070-3084.

Rec. 05-09 recognized the need to establish a clear process and procedures to identify data gaps, particularly those that limit the ability of SCRS to conduct robust stock assessments, and to find appropriate means to address those gaps and evaluate the effectiveness of the ICCAT conservation and management measures. MSE, could be used to conduct cost benefit analyses. Particularly to evaluate how reducing uncertainty can help reduce the risk of failing to meet management objectives.

The Sub-committee continue to express particular concerns regarding the very limited data that so far has been provided from coastal fisheries (*i.e.*, coastal longlines and gillnets) on vulnerable by-catch such as seabirds and sea-turtles. The Sub-committee on Ecosystems, in particular, continues to be concerned that this is limiting its ability to assess the impacts of the ICCAT fisheries on the status of those populations. In addition, the reporting of total dead discards and live releases (see section 2.1) continue to be very poor which impact the estimates of total removal and total mortality needed to conduct stock assessments.

# 4.3 Report on data recovery activities, new plans, and improvements on national data collections systems

With respect to data recovery and improvements, the Secretariat informed the Sub-committee that some major revisions were completed for bluefin tuna with respect to the UNCL and SURF gears. Two new landing series were included to the ICCAT-DB: a series from EU-Bulgaria (recovered by ICCAT GBYP) and the NEI 'inflated landings' for the eastern stock. Similarly for swordfish, a revision of the UNCL and SURF gears were also conducted. In the case of shortfin mako, EU-Spain conducted a full revision of the longline-surf gear. Work in progress includes a revision of the recreational/sport gears, and, the combined tropical purse seine and baitboat NEI fleets ("NEI(ETRO)") prior to 2006, in the process of being allocated to the respective CPCs (CUW, GTM, PAN, CPV, etc.). Data that have been recovered and required approval by SCRS include EU-France ALB (1980-1998) TW (partial catches only) and USA: bluefin tuna (1975, 1978-1985) gear split and gear reclassification (values exist in Task I). Also a full revision of EU-France TRAW (1991-2015) T2CE series still requires SCRS approval. Other data improvements conducted by the Secretariat include albacore: Chinese Taipei LL albacore (1981-2007), Chinese Taipei LL swordfish (1981-2007) which should be further revised because it doesn't have small fish. SWO: USA swordfish corrections (60's, 70's and 80's) on frequency type and various bluefin tuna series (Algeria, EU-France, EU-Italy, EU-Spain, Japan and Canada).

Document SCRS/2017/228 presented a comparison of data collected by EMS and observers onboard of two EU-France purse seiners. The document indicated that the data collected by the EMS and the observers with regard to fishing operations (e.g., type of set, duration, etc.) were in full agreement. However, for some species differences were found with regard to the total estimated catch and/or discards. The document emphasizes the utility of EMS and also that these systems are to complement scientific observers, but not to fully replace them. During the discussion, EMS was considered to have the potential for monitoring some compliance issues such as the FAD moratorium in the Gulf of Guinea. The Subcommittee was encouraged by the information presented in this document and recommended that more of this type of studies be conducted.

### 4.4 Potential methods to evaluate and measure (scores) the quality of data

The Sub-committee Chair presented a potential tool to assess the quality of the size data submitted to ICCAT based on a methodology described by Tsagbey *et al.* (2007). The Sub-committee reviewed some examples of the application of the described methodology to ICCAT data and recommended that the Working Group on Stock Assessment Methods reviews the method and provides further advice. The Secretariat also introduced a tool (preliminary study) to score the (Task I and Task II) data completeness of the ICCAT main species/stocks. The approach considers for the fisheries (flag-gear) that land 95% within a given year range (here 1996 to 2016) of the total landings if they have T2CE, T2CS, and/or T2CS data. Details on the calculations to develop these scores are presented in SCI-008. **Figure 1** shows the results of the application of this scoring system.

		Global score	Score type
ALB-N stock	0	7,0	score3
ALB-S stock	0	5,6	score3
ALB-M stock	•	2,3	score3
BFT-E stock (ATE region)	0	6,0	score3
BFT-E stock (MED region)	•	3,7	score3
BFT-W stock	0	8,1	score3
BET-A stock (AT + MD)	0	6,7	score3
YFT-E region	0	7,0	score3
YFT-W region	$\bigcirc$	4,5	score3
SKJ-E stock	0	7,4	score3
SKJ-W stock	$\bigcirc$	5,1	score3
SWO-N stock	0	8,1	score3
SWO-S stock	0	7,1	score3
SWO-M stock		4,4	score3
BUM-A stock (AT + MD)	•	4,3	score2
WHM-A stock (AT + MD)	$\bigcirc$	5,0	score2
SAI-E stock	•	3,2	score2
SAI-W stock	•	3,8	score2
SPF-E stock	$\bigcirc$	4,5	score2
SPF-W stock	•	4,3	score2
BSH-N region	•	4,2	score2
BSH-S region	$\bigcirc$	4,8	score2
BSH-M region		0,8	score2
POR-N region		2,0	score2
POR-S region		1,3	score2
	•	3,4	score2
SMA-N region		4.7	score2

Figure 1. Preliminary results of the scoring of data availability of the major ICCAT species/stocks.

### 5. Review of existing practices for data submission and validation

### 5.1 Formats (eFORMS), codes, and deadlines

The Sub-committee indicated that no changes have been made to the deadlines to report Task I and Task II data. However, the Sub-committee continues to recommend that CPCs make their utmost effort to report their data in advance of the 31 July deadline to help the Secretariat with its workload.

The Secretariat also informed the Sub-committee on the advancements made in the improvement of the ICCAT coding system. The details can be found in SCI-008.

### *Form ST07-TropSupVes*

The Secretariat informed the Sub-committee that only three CPCs (Belize, EU, and Panama) have provided this information.

### Form ST08-FadsDep

The Secretariat indicated that this form has had a poor response due to difficulties to interpret the different fields and definition. Only three CPCs provided information using this form. In 2017 the tRFMO Working Group on FADs made some recommendations to the SCRS regarding data collection and statistics. These recommendations were reviewed by the ICCAT Working Group on FADs in early September, but the meeting report was not available yet to the Sub-committee on Statistics. Document SCRS/2017/217 provided a review of the different issues identified by the EU-Spain purse seine fleet when using this form. The document also provided with potential solutions to be considered by SCRS. The Sub-committee thanked the authors for their work and indicated that the document is a very useful source to fix issues related to the ST08 form. The Sub-committee recommended that this document be presented at the next meeting of the Tropical Tuna Working Group for its consideration and that that Group develop a revised version of ST08 to be presented at the 2018 meeting of this Sub-committee.

### Form ST09-ObsProg

The Secretariat introduced the revised ST09 form that was revised and approved by the Sub-committee on Ecosystems during its 2017 meeting. The new form is a simplified version of the original ST09. This revision was done with the expectation that a simpler form will increase the reporting rate of observer data. In addition, the Sub-committee agreed to include the current form CP45 (which collects general information on observer programmes) as a sub-form in the new ST09. This new version of ST09 was approved by the Sub-committee which recommended the SCRS to adopt it and start using it in 2018.

### Form ST10-PortSamp

This form was developed in 2015 to report data collected by port sampling programmes covered under Rec. [16-01]. In 2017, submissions were received from six CPCs.

### 5.2 Procedures to revise/approve statistics

The Secretariat indicated that the procedures to revise and approve statistics haven't changed.

- 1. A circular is issued (around February each year) requesting "statistics"
  - For [year 1] or revisions to older years
  - With a deadline (1 day tolerance given)
- 2. No reminders are sent
- 3. CPC submit a "ST" form
- 4. Acknowledged reception
- 5. Validation is checked (filters, etc.)
  - If valid OK (stored GOTO (6))
  - Otherwise (weather corrections are possible OR not) request a revision (GOTO (3))

### 6. After storage it passes through deeper validation process

- (consistency with the past, structural errors, etc.)
- 7. Wait for possible revisions ((3) on arrival / (8) after deadline)
- 8. Prepare the data for the SCRS
  - (a period of 4 to 5 weeks is given to accept late reporting: this year 2017-09-12)
- 9. SCRS deliberation

### 5.3 Tools supporting data submission (tutorials, instructions, videos, etc.)

The Secretariat did not develop any further tutorials or videos to support data submissions. The Subcommittee, while being mindful of the Secretariat's workload, recommended that this activity be continued when possible.

### 5.4 Ongoing work on the ICCAT online reporting system (three initiatives)

The Sub-committee acknowledged ICCAT Rec. [16-19] that established the development (and a technical Working Group) of an Online Reporting System: "An online reporting system shall be developed and maintained at the ICCAT Secretariat covering ICCAT reporting requirements, with an initial focus on elements of the required CPC Annual Reports." However, the Sub-committee recognized that the main goal of this recommendation is to work with compliance and Annual Report submissions and not with statistical forms.

The Secretariat has developed a web-based application for the submission and validation of ST forms. A presentation was made that showed how the application works. The Sub-committed was very pleased with the way the application works and encouraged the Secretariat to continued advancing this work. The Secretariat indicated that at this point it needs to move into a testing phase. The Sub-committee recommended that statistical correspondents that are willing to help with the next phase of the project get in touch with the Secretariat.

A second presentation was made that introduced an FAO Common Oceans/ABNJ tuna project feasibility study named "FORS (Fisheries Online Reporting System". This is also a web-based application to report and validate ST forms, but it also includes a 'communication tool' that allows to keep and track email exchanges among the Secretariat and the statistical correspondents. The Sub-committee was also very encouraged by this application and hopes that further development of it continues into the future.

The Sub-committee noted the value of the two applications and agreed that they are not competing efforts, but that they complement each other. The Secretariat indicated that it will need support from the Commission to advance the online reporting system which the Sub-committee agreed with. However, there was a general agreement that the Commission 'online reporting Working Group' should be made aware of this ongoing effort by the Secretariat. The Sub-committee also recommended that if in the future the 'online reporting Working Group' will consider online reporting for ST forms, then the Working Group should be expanded to include members of the SCRS and statistical correspondents.

### 6. Review of the ICCAT relational database system (ICCAT-DB)

A detailed description of all the work involving the various parts of ICCAT-DB (databases, applications, specific code, documentation, etc.) is presented in the Secretariat report (SCI-008). In addition, the Secretariat also did a presentation (SCRS/P/2017/045) summarizing the current status of the ICCAT-DB, the progress made during 2017 (improvements, ongoing projects, documents, etc.), and, the pending work (ongoing and postponed tasks) that should continue in the future. This Sub-committee expressed its satisfaction and congratulated the Secretariat for the effort, dedication and continuous commitment with the improvement of the ICCAT-DB system.

### 6.1 Improvements, ongoing work, and work plan

The ICCAT-DB system undertook in 2017 a revitalization path foreseeing important future improvement expectations (online reporting systems, improved data dissemination tools, improvements to front-end applications, etc.). Various databases were revised/adapted, to support the changes in the ICCAT regulations. For example, the vessel record database was adapted to support 5 new authorisation lists (ALB-N, ALB-S, ALB-M, SWO-N, and, SWO-M). Various revisions were also made to the statistical set of databases (Task I and II, CATDIS, CAS, etc.) to improve several parts (e.g.: filtering criteria automation) and also to incorporate updates aimed to handle the most up-to-date SCRS requirements. The Secretariat has also started the full redesign of the tagging (conventional and electronic) database module (including applications, forms, special tools, etc.). This ongoing task (recently started) will continue in the future.

The new JAVA "automated data processing framework", used to validate and integrate into ICCAT-DB Task I and Task II forms, in production since 2016, was optimized in various aspects. Most notable is that during 2017, nearly 90% of the ST01 to ST05 forms received during the reporting period were automatically processed (validated and stored) using this framework. The Secretariat is right now extending this framework to process the remainder statistical forms (ST06 under active testing; ST07 through ST10 planned) and also to the conventional tagging forms in the future (as soon as database redesign and electronic forms TG01, TG02 and TG03 are properly adapted). Its JAVA "code base" is also used as the backend data processing engine of the current prototype the Secretariat has also started: the "Online Statistical Data Handling system", a single page web application.

The Secretariat also dedicated a reasonable amount of time validating and improving the ICCAT-DB content, identifying data gaps and problematic datasets for posterior revision by the respective CPCs. This data quality (screening, harmonisation and data completeness processes) improvement work, started three years ago by the Secretariat as a continuous data recovery task. These results have been scrutinised and used entirely by the SCRS and the Commission.

The Secretariat has ongoing the RDMBS migration task (from 2008R2 to version 2016) and expects to finalise it during 2017. There are however, some tasks that were postponed to 2018. The most important ones were, the MS-ACCESS client databases ("t2ce.mdb" and "t2sz.mdb") replacement by SQLITE databases for off-line work, the GIS (shapefiles design, mapping software, etc.) development, and, the vessels record history rebuild (Commission request). The Secretariat had also to delay some work related to the ICCAT cloud infrastructure (various pieces of software for cloud deployment, testing various web solutions, etc.).

The Secretariat is committed, depending on the time availability, to start the postponed projects and continue the ones not yet finalised.

### 6.2 Ongoing documentation work (technical manuals, Javadocs", user guides, etc.)

The ICCAT-DB documentation is made of various types of documents (databases, reference manuals, user guides, "javadocs" from JAVA software, specific articles, etc.). The Secretariat is now (since 2016) treating the documentation process in an integrated way to avoid text redundancy and most importantly, to interconnect the various "pieces" in a single documentation framework, which will strength the "user interaction" potential. This framework is in preparation to be published online (ICCAT cloud infrastructure). The ICCAT-DB documentation process is now continuous (follows its evolution) and the updates will be shown online in real time in the future. Part of the 2017 work was related to improve this integration process, and, very little time (due to the extraordinary workload of the Secretariat) was dedicated to effective "writing". The Secretariat has planned for 2018 to dedicate a larger amount of time to "writing".

### 6.3 Plans to publish some ICCAT-DB data in the ICCAT cloud infrastructure

The cloud infrastructure (4 cloud servers deployed, including the AOTP dedicated server) has been used as the laboratory (development and testing) of many pieces of software used now by the ICCAT community (Secretariat, scientists, ICCAT programmes, etc.), like the RStudio server, the Shiny solution, and others. Right now, the Secretariat has small projects under development (that will become larger solutions) linked to some ICCAT-DB content (coding system, CATDIS, EFFDIS, etc.) for online publication.

During 2018, the ICCAT "Online Statistical Data Handling system" will be deployed in the ICCAT cloud infrastructure (this Sub-committee decision, after seeing the demonstration, and considering that this product is ready for real world tests) for testing and depuration during one year. It will start (end of 2017) with 10 to 15 users (ICCAT statistical correspondents, scientists, and data experts) and, depending on the problems encountered, more users will be added all over the year. Real fisheries and biological data (covering version "2018" forms ST01, ST02, ST03, ST04, ST05, and possibly ST06) shall be used on this phase. The results shall be presented to this Sub-Committee in September 2018, which will decide if this software is ready for "production".

### 7. International and inter-agency cooperation on statistical activities (FAO, CWP, FIRMS, CLAV)

Due to scheduling conflicts between SCRS intersessional meetings and the CWP meeting, no Secretariat staff was able to attend (but, it is following its activity) the CWP meeting in 2017. The Secretariat did, however, update the species identification sheets for yellowfin tuna, north and south albacore, east and west sailfish, and Mediterranean swordfish populations which were assessed by the SCRS in 2016 for FIRMS. The Subcommittee was also informed of the FAO/CWP task group work on harmonization of data structure and metadata among tuna RFMOs. Since the last SCRS meeting, the Secretariat has prepared the entries for the Aquatic Sciences and Fisheries Abstracts (ASFA-Proquest) database of the papers published in issues 3, 4 and 5 and issues 1 and 2 of Volumes 68 and 69 of the ICCAT Collective Volume of Scientific Papers, respectively. ICCAT continues to collaborate with the CLAV and has actively shared data and synchronised information with that system.

### 8. Review of progress on the implementation of the Science Strategic Plan for 2015-2020

The SCRS Chair informed the Sub-committee that a review of the progress on implementing the SCRS Science Strategic Plan would be provided during the 2017 SCRS plenary meeting.

### 9. Discussion of proposed data dissemination and sharingrules

The Sub-committee recalled that during the 2016 meeting it held some preliminary discussion on a set of new data dissemination and sharing rules for the SCRS. The Chair of the Sub-committee informed that a preliminary draft was shared with the different SCRS group chairs and with the WGSAM during its 2017 meeting with the goal of receiving further input. The Sub-committee adopted the following SCRS data dissemination and sharing rules:

- a) Preliminary Task I and Task II and derived estimations (e.g., Catch-at-size, CATDIS) will not be released until they have been reviewed and approved by the Species Groups and the SCRS at its plenary meeting. Preliminary Task I and Task II data will continue to be provided for use in data preparatory and stock assessment meetings and any other SCRS intersessional meetings that require access to these data. The Secretariat will not entertain requests for these data that are not part of the approved work plan of the SCRS Species Groups and Sub-committees.
- b) The Secretariat will provide access to the OwnCloud folders one or two weeks prior to the start of the meetings only to those that have registered to attend the meeting.
- c) At the start of each meeting, new login information will be provided to those that are present at the meeting. During the meeting and until the report is finalized, sharing the new login information with those that are not attending the meeting is strictly prohibited. Exceptions will be made for those Head of Scientific Delegations that are not attending the meeting and that specifically request access to the OwnCloud. Requests to access the OwnCloud by those that are not attending the meeting (and are not Head of Scientific Delegations) will be considered on a case by case basis by the Species Group and SCRS Chairs.
- d) To further increase the transparency of the stock assessment process, the OwnCloud 'Analysis' folder will be made available as an open folder with free access after the meeting report is finalized.
- e) Due to limited space in the OwnCloud, all the open folders mentioned in Paragraph 4 will remain available until the end of the calendar year, after which they will be migrated to a protected "Historic" folder. Access to this historic folder will be provided upon request to the Secretariat.

### 10. Considerations on the Sub-committee on Statistics recommendations (past and 2017)

### 10.1 Progress with prior year Recommendations of the Sub-Committee

- The Sub-committee recommends that the Species Working Groups assign, along with the "text rapporteurs", a "data rapporteur" during stock assessment and data preparatory meetings who will be responsible for ensuring that all model run inputs and outputs on which management advice is based, are copied to data folders on ownCloud potentially using a standardized format. It is recommended that the Secretariat stores these files in a common assessment output repository which can be easily accessed by the SCRS. This approach would facilitate the request made by the Sub-committee on Ecosystems that stock assessment models made readily available to use as fishery indicators for the EBFM framework.

The Sub-committee recognizes that significant advances have been made in implementing this recommendation by some of the species groups that conducted stock assessments during 2017.

- The Sub-committee recommended that the Secretariat revises the data submission requirements for Task I and II, and compliance, and the electronic forms used for such submissions to identify cases where double reporting (possible redundancy in data requirements) might be occurring. For those cases, the Secretariat will present a proposal to combine electronic forms to the SCRS for those cases where double reporting is occurring.

The Secretariat informed the Sub-committee that an initial revision of the eForms of type "ST" (statistics) showed no redundancy in data reporting. Nevertheless, this redundancy elimination work should continue in the future taking into account all the ICCAT official forms (statistics, tagging, and compliance) and the existing ICCAT data requirements. The Secretariat also indicated that as new data reporting requirements are adopted by the Commission it will continue to perform these revisions on a regular basis.

- The Sub-committee requested that CPCs make their utmost effort to report their Task I and II data in advance of the 31 July deadline. Doing so will allow the Secretariat to process the data faster and contact CPCs when errors/mistakes are found so they can be corrected before the submission deadline.

The Secretariat indicated that no significant improvement on this issue was observed in 2017.

- The Sub-committee recommends that starting in 2017, CPCs report Task II data by month only. Submissions that provide data on quarterly, semiannual, and annual time steps will not be incorporated into the ICCAT-DB and will be considered a wrong submission. The 2017 version of the ICCAT electronic forms for Task II (ST03, ST04 and ST05) should be updated accordingly. In consequence, only 2017 versions of the forms can be used to submit statistics during 2017.

Only a few submissions used other than monthly time steps. The ST03, ST04, and ST05 were modified as requested by the Sub-committee.

- The Sub-committee recommended that the Secretariat delete landings reported for *Scomber scombrus* from the ICCAT-DB as this species is not under the purview of ICCAT and the SCRS.

This task was completed by the Secretariat.

- The Sub-committee recommended that the Secretariat develop a proposal for the Tropical Tunas Working Group to revise the historical series of landings of the three species at once. It is unpractical that the yellowfin, bigeye, and skipjack Working Groups develop their own revisions for a fishery that is multispecies in nature.

The Sub-committee was informed by the Secretariat that this is an ongoing task that is also being coordinated with the Tropical Tunas Working Group.

- The Sub-committee recommends that the Secretariat work intersesionally with the SCRS Chair, Chairs of the two Sub-committees, and Chairs of all Species Groups to develop a proposal with new guidelines for the sharing and dissemination of SCRS data. This proposal will be presented at the next meeting of the Sub-committee on Statistics for its consideration. If possible, the Sub-committee also recommended that a draft of this proposal be presented at the next meeting of the WGSAM for its early consideration and discussion by SCRS.

This task was completed and new data dissemination and sharing rules were adopted by the Subcommittee.

- The Sub-committee reminds all Chairs of the SCRS species groups and Sub-committees that they must attend the meeting of the Sub-committee on Statistics. If for any reason they are unable to attend, they should then appoint a proxy that can represent the Group at the Sub-committee on Statistics meeting.

The Sub-committee informed the SCRS that not all Chairs of SCRS Species Groups attended the meeting of the Sub-committee (as it is required) nor they appointed a proxy to represent them neither.

- The Sub-committee recommends that National scientists review the results of the newly estimated EFFDIS to ensure accuracy.

The Secretariat informed the Sub-committee that comments/suggestions were received from only one CPC.

### 10.2 Review of Recommendations from 2017 inter-sessional meetings

The following recommendations for statistics from the 2017 inter-sessional meetings were reviewed and endorsed by the Sub-committee.

### Bluefin tuna

- CPC scientists from EU-Germany, EU-Sweden, and EU-Denmark revise their historical Task I catch series (50s and 60s) and, whenever possible, provide the respective Task II (catch and effort, and size samples) information.
- Efforts to recover catch/size/effort data from documents/reports from ICES and other sources be continued. This size information should be reviewed by the Group for its adoption and inclusion into the ICCAT-DB.

- The Group requests that the historical and future time series of Mediterranean purse seine catches between small (<160 SFL) and large (>160 cm SFL) fish be better partitioned.
- The Group reiterates the importance of all CPCs to review and submit their Task II size frequency data by fleet. Furthermore an effort must be made to fill in the gaps in the size composition data (historical and future) to be representative of the temporal and spatial fishing patterns.

## Sharks

- The Group recommends that CPCs continue the recovery of Task II CE and SZ data.
- The Group recommends that CPCs continue to revise their historical shark catches with the aim of classifying "unclassified" catch reports into the appropriate species.
- The Group noted the importance of having the sex information on the conventional tagging database. Such data are usually reported for sharks, but currently are not available in the ICCAT database. Therefore, the Group recommends that the Secretariat revises the conventional tagging database to include this field and make it available in the cases where such information was reported.

## Swordfish

- To CPCs on discards. Current information on discards of swordfish (both dead and alive) are still very scarce in the ICCAT databases and inconsistently reported by CPCs. The information on the sizes of discards, and the numbers discarded scaled to the total effort (data for both discarded dead and released alive) should be reported in order to quantify discarding in all months and areas. These data must be reported as required by ICCAT Recs. 13-02 and 15-03.
- To CPCs on submission of Task I and II data. All CPCs catching swordfish (directed or by-catch) should report catch, size samples (by sex), catch-at-size (by sex) and effort statistics by as small an area as possible, and by month. Recognizing the differential growth and distribution between sexes, collecting size distribution information by sex is particularly important. The Group strongly reiterates the need for respecting deadlines and providing the data in the ICCAT standard formats, even when no analytical stock assessment is scheduled, as required by ICCAT Recs. 13-02 and 15-03. Missing or incomplete historical data should also be provided.
- Data submission: The Group reiterates that CPCs should comply with all aspects of their data submission obligations which include the reporting of estimates of dead discards and, when possible, live releases.
- Estimation of dead discards: The Group recommended that, until CPCs fully comply with their obligations to report dead discards, the use of observer data as a tool to estimate dead discards as a proportion of the total landed catch be explored.

## Small tunas

- Statistical Correspondent and/or National scientists should revise, update, complete and submit their small tuna T1NC series to the Secretariat. This revision should take into account, the replacement of the carry overs, the split of "unclassified" gears by specific gear codes, and the completeness of Task I gaps identified.
- The Statistical Correspondent and/or National scientists of CPCs should correct inconsistencies identified in T2SZ series. These inconsistencies include, among others, outliers in size measurements, heterogeneity in frequency types (FL, CFL, WGT, HGTW, etc.) and class types (1 cm, 2 cm and 5 cm; 1 kg, 2 kg and 5 kg), and heterogeneity in time (by year, by quarter) and geographical (1x1, 5x5, ICCAT sampling areas, "unknown") strata. For the 13 species of small tuna, the T2SZ revision should have as reference, the stratification of the samples by gear, month, 1°x1°or 5°x5° squares, and, FL size classes of 1 cm (lower limit).

- CPCs should further improve their estimates of total catches, as there are still important gaps in the basic data available. These data are required inputs for most of the data limited stock assessment methods.
- The Secretariat should continue its work on the data recovery and inventory process of tagging data for small tuna. This process will require active participation of the National scientists that hold such data.

## Albacore

- For the Mediterranean stock, in principle, changes in mean size of the catch may reflect changes in the age/size distribution of the population and/or changes in the selectivity of the gear(s) or other factors indirectly affecting size selectivity. In order to evaluate annual trends of mean size it is necessary to identify the possible factors) that could explain variability on observed size frequency samples. The Group recommends that methods of standardizing length measurements be implemented. A method for standardizing length data has previously been submitted to the SCRS (Ortiz and Palma, 2012). In addition to length standardization, the Group recommended to conduct a review and collation of all the available data on age-length pairs available from the various studies that have estimated age from spines with the view to update the estimate of the growth curve for the species. It is also recommended that methods of accounting for selectivity in the year 1 cohort in von Bertalanffy growth function (VBGF) be explored to ensure accurate parameter estimation.

## Ecosystems

- The Sub-committee requests that CPCs continue or initiate the submission of Task I information for non-target teleost species not categorized under the main/small tuna or shark categories (e.g. oilfish, escolar, Atlantic pomfret, etc.).

## FAD Working Group

- SCRS reviews and recommends additional changes, as appropriate, to the minimum standard reporting requirements on data to be collected in FAD fisheries through logbooks.

(Note: see section 5.1 of this report)

## 11. Replies to the Commission related to Rec. 16-14, paragraph 12

The Sub-committee discussed that some of the information required by Rec. 16-14, paragraph 12, already exists and needs to be compiled. There was a general agreement that a complete response to this recommendation will require coordination among several SCRS Working Groups. It was also agreed that the SCRS Chair, the Chair of the Sub-committee on Ecosystems, and other SCRS Chairs will draft a response to the Commission to be reviewed during the 2017 SCRS Plenary meeting.

## 12. Other matters

The co-convenor of the Sub-committee on Ecosystems requested the opportunity to discuss with the Working Group Chairs the proposal to develop the content for both ecosystem report cards and an ecosystem based fisheries management plan for ICCAT. The co-convenor also noted the need to provide for regular opportunities for the Working Group and ecosystem Chairs to meet and exchange information. The development of the content for the report card was described to occur inter-sessionally in preparation for the 2018 Sub-committee on Ecosystem meeting. It was requested that the Working Group Chairs participate in, and/or lend their expertise to, the development of the components of the report card that relate to their particular species. The co-convenor also indicated that Working Group Chairs will be contacted regarding their participation in the project.

## 13. Future plans and recommendations

- The Sub-committee reminds CPCs of their obligation to report total discards and live releases. The Sub-committee also recommends that the SCRS explores ways to provide capacity building to those CPCs that need it to comply with the discard reporting requirements.
- The Sub-committee again reiterates that CPCs should report their observer data and any other information needed to advance the assessment of the efficacy of seabird mitigation measures as well as the impact assessment of ICCAT fisheries on sea turtles.
- The Sub-committee recommended that CPCs revise their historical series of Catch-and-Effort and Catch-at-Size.
- The Sub-committee reiterates previous recommendations that submission of T2CE data should be done for all species at once. When CPCs report T2CE data for several species separately, the Secretariat cannot interpret the effort data and, therefore, it is not possible to combine de different data sets.
- The Sub-committee recommended that the Secretariat change the start of the 'reporting period' to 1 October from the current date of 1 December.
- The Sub-committee endorsed the ongoing work by the Secretariat to develop an online reporting system for statistical data. The Sub-committee recommends that Statistical Correspondents interested in helping in the testing of this new system to work with the Secretariat.
- The Sub-committee recommends that the Commission provides the Secretariat with all the support needed to complete the online reporting system. In addition, the Sub-committee recommends that the Commission 'Online reporting Working Group' be expanded to include members of the SCRS and statistical correspondents.
- The Sub-committee recommended that the Secretariat modifies the ST04-T2SZ and ST05-T2CS (renamed from ST05-CAS) form to allow the reporting of data only by month and for several years in the same form. Moreover, form ST04-T2SZ should drop geographical grids of type "20x20" and "10x20". These modifications should be made for the 2018 forms version (to report 2017 data). In addition, the Sub-committee also recommended that the Secretariat explores the possibility of further modifying these forms to allow the reporting of data for several species in the same form (study to be presented at the 2018 Annual meeting).
- The Sub-committee recommended that the ST08-FadsDep be revised by the Tropical Tunas Working Group taking into consideration the results presented in document SCRS/2017/217. The revised form should be presented at the next meeting of this Sub-committee.

## **Future Work**

## Finalize "short term" ongoing projects

Web-form prototyping (for ST forms 1 – 6). 7 – 10 to be started.

JAVA application to validate ST forms (ST01 to ST06) for CPC scientist's use

Replacement of MS-ACCESS (t2ce.mdb & t2sz.mdb) by SQLite 3.8+ databases

## Continue "long term" ongoing projects

Continuous update of the ICCAT-DB documentation framework

Maintain the work on the ICCAT cloud infrastructure (deployment/integration of services)

Continue the work on the GIS system (terminate sampling areas geo-referencing :: shapfiles)

Continue the development of an online reporting system as requested by the Commission.

## Start projects (short/long term)

"Full" redesign of the "tagging" database (conventional/electronic) system :: (long term)

Migration of MS-SQL server 2008R2 to a new version - URGENT (outdated now)

ISSF data unloads project (if no decision is made, these data can never be properly used)

# AND SIMULTANEOUSLY: the ICCAT-DB content/the meetings preparation/the estimations

Continue data recovery (data gaps, better resolution and normalization of Task II)

Continue improve of Task I (eliminate carry overs, allocate NEI catches to proper flags, reduce UNCL gears, etc.)

Provide the most up-to date INFO to SCRS

## 14. Adoption of the report and closure

The Chair thanked the participants for their attendance to the meeting and he thanked the Secretariat staff for their continued support of the Sub-committee's work and acknowledged how difficult its work would be without the full assistance of the Secretariat.

The report of the meeting was adopted by correspondence.

Appendix 10

## Report of the 2017 intersessional meeting of the Sub-committee on Ecosystems

(Madrid, Spain, 10-14 July 2017)

## 1 Opening, adoption of Agenda and meeting arrangements

The meeting was held at the ICCAT Secretariat, Madrid, 10-14 July 2017. Dr. Miguel Neves dos Santos, ICCAT Assistant Executive Secretary, opened the meeting on behalf of the Executive Secretary and welcomed participants. The Sub-Committee on Ecosystems convener, Dr. Alex Hanke (Canada) and interim By-Catch convener Dr. Andres Domingo reiterated the Secretariats welcome. The Conveners then described the objectives and logistics of the meeting. The Agenda was adopted with several changes (**Appendix 1**).

The List of Participants is included in **Appendix 2**. The List of Documents presented at the meeting is attached as **Appendix 3**. All the abstracts for the presented documents and presentations are provided in **Appendix 4**. The following participants served as rapporteurs:

Section	Rapporteurs
Item 1	P. de Bruyn
Item 2	M-J. Juan Jordá, D. Álvarez, R. Coelho
Item 3	B. Luckhurst, A. Hanke
Item 4	G. Diaz, P. de Bruyn
Item 5	K. Okamoto, J. Swimmer,
Item 6	Y. Inoue, K. Oshima, A. Wolfaardt, B- Mulligan, J-C, Baez
Item 7	F. Poisson, P. de Bruyn
Item 8	A. Hanke, A. Domingo, S. Tsuji
Item 9	A. Hanke, A. Domingo
Item 10	P. de Bruyn

## 2 EBFM

2.1 Review the progress on developing an Ecosystem Report Card for ICCAT and review potential status and pressure indicators, reference levels and management actions for elements of ICCAT's EBFM framework and any progress on developing new indicators for all ecological components of ICCAT's EBFM framework (i.e. target species, by-catch, habitat and trophic relationships)

Document SCRS/2017/140, Part 1 had two main objectives, first to initiate a discussion for the need and usefulness of an indicator-based ecosystem report card, and second, to provide a potential template for an ecosystem report card to contribute on the process towards its full development and use.

It was clarified to the Sub-Committee that monitoring and updating the state of the target species component will be based on the stock status that are routinely provided by Species Working Groups. Challenges remain for the by-catch components where few formal assessments exist and the total number of interactions and mortalities of some of these species with tuna fisheries remain unknown or poorly known. The Sub-Committee noted that information for the trophic relationship component is presently insufficient to advance the work on this component.

It was noted that environmental indices and related information are already being used and incorporated in the fisheries stock assessment process for some of the main target species, either as part of the CPUE standardizations or in the actual assessments.

The Sub-Committee noted that the main focus of the ecosystem report card is currently the ecological dimension, but the socio-economic and human dimensions are also fundamental and should be taken into account when implementing an ecosystem approach. While the incorporation of socio-economic information is important, at this stage ICCAT does not collect socio-economic data. It was commented that there is socio-economic information routinely collected outside ICCAT by other organizations, for example by FAO, but not in a way that can be immediately used by ICCAT. It was also noted that there is socio-economic information collected at national levels but the challenges remain to scale this information up to the RFMO level. However, the Sub-Committee encouraged that this type of information be presented by national scientists.

The study presented a series of activities and the development of several products to support the development and refinement of the ecosystem report card such as an ecosystem synthesis report, an integrated ecosystem assessment and an ecosystem plan. The Sub-Committee inquired who would be responsible and the timeline for implementation of these activities. It was discussed that it would undoubtedly increase the work load for the Sub-Committee including the scientists and the Secretariat, and that the development of these proposed activities might need to continue relying on the inputs of the CPC scientists and funding from national projects such as a recently funded EU project (see below). As the proposed work to complete the ecosystem report cards is substantial there will be a need to prioritize the work.

It was also noted that the traffic light approach (i.e. the use of red, yellow and green colours) is a very powerful tool to communicate information that should be considered when the indicators are presented. It was also recommended to frame the main goals and questions for each ecosystem component that needs to be monitored (target species, by-catch species, trophic relationships and habitats) as part of an ecosystem approach. The temporal and spatial scales are also important considerations as various indicators may be relevant at different scales. It was recommended that before defining indicators it is necessary to identify at which scales they should be applied.

SCRS/P/2017/024 provided an overview of the issues related to developing ecoregions and representative indicators for an Ecosystem Report Card for ICCAT using Task I and II data.

The Sub-Committee discussed that numerous indicators were provided and these can likely not all be accommodated in the report card. By disaggregating the indicators to lower levels (e.g. by fleets and stocks) it might make the report card too complex for management purposes. The Sub-Committee agreed that the ultimate goal should be to find simple indicators to communicate the state of each main ecosystem component in simple ways. It was highlighted that the Commission is ultimately interested in the sustainable management of the main target species of tunas and tuna-like species. It is essential that the main purpose of the ecosystem report card and its ecosystem component, (e.g. the target species component) the Species Working Groups should provide input about the identification of potential indicators and participate in their development.

The Sub-Committee reiterated the need to have a discussion on defining what would be the ideal vs practical spatial scales for the choice of potential ecoregions. While some ecosystem areas make ecological sense, it was recognized that the optimum or practical spatial scale is dependent on the type of indicator and the management questions.

It was discussed that many of the current data sets in the ICCAT website and scientific products created by the Working Groups have the potential to be used to develop some of the proposed ecosystem indicators.

Document SCRS/2017/140, Part 2, presented an integrated multispecies  $B/B_{MSY}$  and  $F/F_{MSY}$  ratio, which have been used by some organizations to diagnose the state of the fished and assessed part of an ecosystem. These multispecies  $B/B_{MSY}$  and  $F/F_{MSY}$  ratios were calculated at several spatial and taxonomic scales, and they were estimated using hierarchical models to account for the several runs and models used by the SCRS to provide management advice for each assessed stock. These indicators should be treated as preliminary since they need to be further tested and developed.

The Sub-Committee asked for clarifications on how the single species ratios of  $B/B_{MSY}$  and  $F/F_{MSY}$  were extrapolated both backwards and forward in time. It was noted that there is a reason why stock assessments have a starting year and there might be an issue to extrapolate.

The Sub-Committee asked how the uncertainty of the single  $B/B_{MSY}$  and  $F/F_{MSY}$  ratios was accounted for in the estimation of the integrated ratios. The assessment of the different stocks contains uncertainties in the input data quality and the assessment methodology; therefore the aggregation process may introduce bias making it difficult to interpret the indicators. It was discussed that there are plans to explore different ways to account for uncertainty as this is an important issue.

The Sub-Committee also noted that the integrated  $B/B_{MSY}$  and  $F/F_{MSY}$  ratios for the ecoregions had no appropriate reference level. It was also highlighted that the integrated ratio calculated for different taxonomic groups and spatial scales must be interpreted with caution.

The Sub-Committee noted that by combining assessment results for the 21 assessed ICCAT stocks, the integrated ratios are a mix of data-rich and data-limited stocks with different levels of uncertainty. The Sub-Committee also noted that the integrated ratios combine stocks with different productivities and biomass levels, even when the ratios are combined by major taxonomic groups, and that it might not be appropriate to combine those in the same indicator. These integrations also ignore species interactions.

The Sub-Committee discussed that the estimation of multispecies integrated indicators to represent the overall status of the assessed part of the ecosystem is still an approach to be further explored. However, it was acknowledged that these indicators might be too complicated to be interpreted and it may be difficult to link them with management actions. The Sub-Committee suggested to further investigate why and how this integrated indicator is used within other organisations. It was also highlighted that it is essential to have specific objectives before an indicator is developed, to ensure that they can answer specific questions relevant to the sustainable management of ICCAT tuna and tuna-like species.

SCRS/P/2017/030 presented the main objectives and expected outcomes of the Specific Contract No. 2 under the Framework Contract EASME/EMFF/2016/008 which provides scientific advice for fisheries beyond EU waters to the European Commission. This project will be addressing some of the current impediments and will provide solutions that shall support the implementation of an Ecosystem Approach to Fisheries Management through collaboration and consultation with the key tuna RFMOs, specifically ICCAT and IOTC.

The Sub-Committee inquired what was the link between the presented EU project and the current activities being carried out by the Sub-Committee. The author clarified that this project is funding several activities that will be generating products that are intended to assist and support the current work of the Sub-Committee. The Sub-Committee indicated that it would like to collaborate in the activities of the project and be informed of the progresses made. The author clarified that there are plans to present and share the results and main findings of the project in the next Sub-Committee meeting with the objective to get feedback from the Sub-Committee and find ways that the products can better assist the ongoing work of the Sub-Committee.

SCRS/P/2017/028 presented the current advances from a multidisciplinary joint research initiative linking tuna species ecology and operational oceanography. The analytical approach of this initiative is based on three main tasks, 1) investigate tuna environmentally driven traits, 2) develop indicators for identified environmental processes (operational oceanography tools) and 3) apply the developed indicators to improve assessment of tuna species. The operational products developed provide information on variability of oceanographic processes driving tuna ecology traits, distribution of spawning and larval habitats, larval abundance indices and survival.

The Sub-Committee discussed several examples of how environmental indicators could be developed. It was not clear how and what environmental indicators could be used as inputs in the ecosystem report card if generated for the entire Convention area. There is a need to clarify what specific questions are intended to be addressed with the ecosystem report card and whether the report card can be divided into smaller spatial scales or regions where it would be easier to identify the environmental drivers. It was highlighted that it is important to identify the right hypotheses, before developing the indicators.

It was noted that it is difficult to interpret ecosystem indicators which may respond to both fishing pressure and environmental variation. In these cases, the development of appropriate environmental indicators is important and needed to disentangle the effect of fishing from the environment at the right spatial scales. It was also noted that the use of environmental and oceanographic data could help to inform the definition of ecoregions within the ICCAT Convention area.

It was clarified that the operational oceanographic platform described in the study focuses on producing environmental products for the western Mediterranean, but the main methods and derived knowledge on the processes linking oceanography and the ecology of tunas and tuna-like species can be transferred to other areas of the Mediterranean Sea or the Atlantic Ocean. It was also clarified that several environmental indicators produced by this study are already being used by the bluefin tuna and albacore Working Groups in the assessment.

The Sub-Committee requested that the author make a summary table of potential indicators that could be used by the Sub-Committee (**Table 1**).

SCRS/P/2017/034 presented an analysis of the current status, required time for rebuilding, future catch, and future profitability for 397 European fish stocks (Mediterranean, Black Sea, and North-East Atlantic stocks).

The Sub-Committee noted that not all stocks may be fished optimally relative to MSY and this was not taken into account in the study. The author clarified that this is an issue in such types of meta-analysis and that predicting all the interactions would be very complex. The author explained that the meta-analysis of many stocks can still provide indicators of the overall status of stocks in a region and that this study mainly highlights the poor status and the many challenges faced by fisheries in the Mediterranean Sea. Since it would be difficult to achieve MSY for all stocks, there will be a need to decide if the management should ensure the most vulnerable stocks are not fished below safe biological limits. There were also some discussions on the use of economic indicators in the analysis.

The Sub-Committee suggested extending the work to contrast the status of prey versus predators, and examine the different responses. The profitability of fisheries on top predators may be linked to the level of exploitation on the prey species (e.g. sardines, anchovies). It was clarified that it is difficult to model the complex interactions between top predators and prey species. It is, however, important to monitor such interactions which may potentially impact the fisheries.

## Draft Ecosystem Report Card

The Sub-Committee discussed the proposal to develop a prototype Ecosystem Report Card which could be presented to the SCRS in 2018. A preliminary prototype of the Report Card including the purpose, audience and structure was reviewed along with a proposal for a road map. Both the road map and the general structure of the report are given below.

It was discussed the possibility of meeting with the SCRS Working Group chairs at the 2017 Working Group Meetings and it was noted that a proposal could be provided at the meeting of the SCRS officers or at the conclusion of the meeting of the Sub-Committee on Statistics. The Sub-Committee discussed how the prototype would be completed in the absence of expert support and it was indicated that components with no input would simply be left blank.

## Road Map

## 2017 SWG meeting

A Proposal will be presented to the chairs of the Species Working Groups. The Proposal will include the Preliminary prototype Report Card with rationale and a proposal for implementation. Further, the chairs will be requested to provide inputs for the report in accordance with the guidelines provided below.

## 2018 SC-Eco Meeting

A prototype of the Report Card will be developed inter-sessionally and presented to the Sub-Committee for review and the implementation plan will be updated. The report will be populated using the inputs provided by the Working Groups and relevant experts.

## 2018 Commission Meetings

The proposal to implement an ecosystem Report Card will be introduced in order to attract feedback and achieve agreement in principle to implement this tool.

## Purpose

The Sub-Committee agreed that the purpose of the report card is to assist the Commission advance the implementation of EBFM by monitoring the state of the ecosystem components supporting ICCAT fisheries.

## Regions

The Sub-Committee noted that the exact boundaries for the regions and their number have not yet been defined but interim options are to choose the whole Convention area, to use the definitions proposed in SCRS/2017/P/024 or some combination of the two options.

## Ecosystem Components

The proposed structure for the Ecosystem report card includes the components listed below. Retained species (tuna, billfish, sharks):

- Non retained species
  - Seabirds
  - Turtles
  - Mammals
  - Sharks
- Trophic relationship
- Habitat
- Socio-economic
- Fishing pressure

## Retained Species (tuna, billfish, sharks)

*Goal:* Ensuring long-term sustainability and optimum utilization of the retained stocks *Questions:* Whether the harvest level of all retained stocks is maintained over agreed biomass target levels *Potential indicators:* 

Proportion of stocks for which  $F/F_{MSY} > 1$ 

 $F/F_{MSY}$  of a reference stock(s) (that which has the highest sensitivity to exploitation pressure) Proportion of retained stocks that are assessed

## Non Retained Species (seabirds, sea turtles, sharks and mammals)

*Goal:* Minimizing the interactions and mortality as practically as possible *Questions:* Whether the number of interactions and/or total mortality is reduced *Potential indicators:* 

Total mortality estimates of seabirds/sharks/mammals/sea turtles (possibly select a sensitive species) Total interaction estimates by group (possibly select a sensitive species)

## **Trophic Relationships**

*Goal:* Ensuring that ICCAT fisheries will not cause adverse impacts on the structure and function of the communities.

**Questions:** Whether trophic interactions and inter dependencies involving species that are affected by fishing are maintained

## Potential indicators:

Trophic level indicator of catches taken by tuna fisheries (e.g. estimated based on observer data) Diversity indicators of catches taken by tuna fisheries (e.g. estimated based on observer data)

## Habitat

*Goal:* Ensuring that the tuna fisheries will not cause adverse impacts on critical habitat *Questions:* Whether ICCAT fisheries impact on critical habitat *Potential indicators:* 

Proportion of lost/abandoned gears to total gears used (possible?) The number of FADs lost

The cumulative biomass of species that are caught in bait fisheries

Socio economic Goal: Maximise social well-being or quality of life of fishing communities Questions: Whether ICCAT fisheries reduce the quality of life in fishing communities Potential indicators: The employment rate of people working in ICCAT fisheries The median annual income of fishermen working in ICCAT fisheries

*Fishing Pressure Controlling indicators:* Total catch Total effort

## 2.2 Review the proceedings of the Joint meeting between tRFMOs on the implementation of the EBFM approach

SCRS/2017/P/025 provided a report of the Joint Meeting of Tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management. The meeting was held on December 12 to 14, 2016 at the FAO headquarters in Rome, Italy and the complete report can be accessed here: <a href="http://www.fao.org/fileadmin/user-upload/common-oceans/docs/JointTunaRFMO\_EBFM\_Meeting.pdf">http://www.fao.org/fileadmin/user-upload/common-oceans/docs/JointTunaRFMO\_EBFM\_Meeting.pdf</a>

This information was also presented to the SWGSM meeting held in Madrid from June 29 to 30, 2017 and was well received by managers. The Sub-Committee acknowledged that ICCAT is already implementing some of the elements of EBFM. However, there is a need to continue and deepen the dialogue with managers to further advance this process. It was noted that to implement Ecosystem Based Management (EBM), sources of impact to the ecosystem other than fisheries need to be taken into consideration. However, the Sub-Committee agreed that at the present time it is not in a position to do so.

The Sub-Committee also discussed the difficulties to implement EBFM at the RFMO level. In other words, it is easier to advance and implement this concept at a national level where different sources of impact can be more easily managed than doing it at an international level. This is due to the fact that RFMOs often adopt management measures by consensus.

Furthermore, ICCAT can only control the impact of tuna fishery operations but it doesn't have the authority to somehow manage impacts unrelated to fishing (e.g. oil exploration). The Sub-Committee discussed if EBFM is already part of the tRFMOs mandate, and it was agreed that the situation is different among all these organizations. The Sub-Committee also warned about comparing the advancements in implementing EBFM among the different RFMOs. For example, the Commission for the Conservation of Antarctic Marine Living Resources (CCAMLR) has the mandate to conserve all marine living resources, while ICCAT has the mandate to manage tuna and tuna-like species.

## 3 Ecology and Habitat

# 3.1 Review information on the trophic ecology and habitat of pelagic ecosystems that are important and unique for ICCAT species in the Convention area

SCRS/2017/148 provided information on aspects of the ecology of squid and their importance in the pelagic trophic web of the northwest Atlantic including the Sargasso Sea. In the northwest Atlantic, two species of squids are commercially exploited: Northern shortfin squid *Illex illecebrosus* (Ommastrephidae) which is an oceanic species and the longfin squid *Doryteuthis* (*Loligo*) pealeii (Loliginidae) which is a neritic species. The populations of both of these species are strongly influenced by the Gulf Stream, a powerful western boundary current system. Most squid species have life spans of a year or less and, as a consequence, their populations often display irregular annual fluctuations in abundance. As squids function as both predator and prey, they play an important role in the trophic web of pelagic ecosystems. Ommastrephidae are major contributors to the diets of large pelagic fishes in the central north Atlantic and all five tuna species (Thunnidae) plus swordfish (*Xiphius gladius*) managed by ICCAT have squid as an integral prey group in their diets. Squids are essentially "annual" species and are highly responsive to changes in their environment. Due to the importance of squid species in pelagic ecosystems, there is a need to incorporate data on these species into any ecosystem-based fisheries management (EBFM) model for tuna and tuna-like species.

The Sub-Committee was interested to know if there was data available to support the development of an abundance indicator for squid and queried if any t-RFMO collected stomach content data as part of a regular sampling programme. It was noted that the IATTC does collect stomachs as part of their sampling programmes but no further details were available. Analyses of stomach contents generally do not contain whole squid because they are quickly digested, however their beaks remain and can yield information on species, abundance and size estimates. Quantitative assessments are conducted for some species of squid at these data can be obtained from FAO. It was also stated that the Republic of South Africa conducts squid stock assessments. Given that squid are so short- lived the ecosystem indicator would largely be a function of recruitment success which is heavily influenced by environmental factors. It was noted that squid are also an important food source for seabirds as well as a source of bait in longline fisheries resulting in further fishery-related linkages. It was encouraged by the Sub-Committee that the fraction of the diet composed of squid be determined for the major ICCAT species.

SCRS/2017/160 provided a single Ecological Niche model for skipjack tuna (SKJ) in the eastern Central Atlantic Ocean (AO) and western Indian Ocean (IO) using data from the European purse seine fleet. Chlorophyll-a fronts were used as a proxy for food availability while selected physical variables defined the abiotic preferences. Skipjack feeding habitat spanned from latitudinal occurrence of eddy-type productive features at mesoscale in the IO to large-scale upwelling systems that seasonally shrink and swell in the AO. About 83% of FAD free sets and 75% of FAD sets were within 25 km of the estimated preferred habitat while in the AO, 34% of FAD sets occurred at distances greater than 100 km, in the relatively food-poor Guinea Current which may correspond with favourable spawning and larvae habitat. Results emphasized higher skipjack accessibility to purse seiners in months when the habitat is reduced. Moreover, the positive correlation found in the IO between the annual size of preferred habitat, and in recent years for the AO, with both the annual nominal catch rates and total catches of skipjack suggests interpreting the habitat size as an indicator of the carrying capacity of this fast-reproducing species.

The mechanistic relationship between estimated habitat size and catch rates was questioned by the Sub-Committee and it was suggested that the population concentration of skipjack increases as habitat size decreases. Further, given the closer proximity of the FAD sets to the estimated preferred habitat it was suggested that FAD location also be a covariate in the model. This was attempted but gave inconsistent results. The Sub-Committee recognized that the model did not predict the area of high catches in the AO as well as the IO and wondered if it was possible to characterize the environmental conditions of the preferred habitat in the AO better. Although improving the fit was a future objective it was noted that the current model was still reasonably accurate for the AO. Lastly, the Sub-Committee observed that the habitat variables were equally weighted in the model and it was suggested that an alternative weighting scheme which favoured the more important determinants of presence should be considered.

Document SCRS/2017/133 presented a species distribution model (SDM) for swordfish using a habitat suitability framework. Currently, the model integrates ocean depth, annual average estimated total chlorophyll, temperature and oxygen. Model predictions and general distributions of North Atlantic swordfish catches are used as criteria for the inclusion and treatment of variables. Initial trials demonstrated that the habitat cannot be predicted using temperature and oxygen alone. The inclusion of the spatial annual average productivity via chlorophyll markedly improved distribution predictions. The current formulation predicts the north-south seasonal migration in the North Atlantic but also predicts high abundance in areas of low swordfish catch. Better, time-varying data for ecosystem productivity relevant to swordfish might resolve this problem, but important habitat features may also be missing.

The Sub-Committee questioned the lack of agreement of the preferred habitat with the location of high catches of swordfish in the tropical South Atlantic and it was clarified that the poleward migration of swordfish from the tropics occurs at the same time in both hemispheres and correspond to different seasons in the different hemispheres. For this reason, catch rates of swordfish in the Republic of South Africa EEZ are typically higher in the winter and it was suggested that the relationship between the CPUE deviates and habitat volume be determined for this region. Future improvements to the model included incorporating zooplankton and micro nekton covariates and examining the annual variability in the habitat volume relative to the spatial variation in catch rates. Other explanatory variables suggested by the Sub-Committee related to the presence of horizontal temperature or salinity gradients and the number of fronts. Some factors that were suggested to inform the model like reactions to vertical gradients of temperature and salinity or the habits of this endothermic species are reflected in the PSAT data. A discussion on the mismatch between catches and the estimated habitat in some areas was thought to be a function of how

male and female swordfish are distributed and/or variability in the distribution by age. Though including this variability in the model was considered to be dependent on good PSAT data, which is currently not available, it was recommended that the Task II size data could be used to determine if these hypotheses were plausible. Lastly, there was interest by the Sub-Committee to generate products from the model such as annual indicator of habitat volume by area and/or indicators of the relative location of the optimal habitat. Further it was noted that this information could help to define the regions of the Ecosystem Report Cards

## 4 Data used for by-catch analyses

## 4.1 Revision and update of ST09 forms

In 2016, both the Sub-Committee on Ecosystems and the Sub-Committee on Statistics recommended that the existing ST09 observer data submission forms be revised to simplify the reporting requirements with the expectation that the revision will help to increase the submission rate of observer data. This work was to be conducted intersessionally through collaboration between CPC scientists and the Secretariat with a preliminary version to be presented to the Sub-Committee on Ecosystems and the Sub-Committee on Statistics, and for potential adoption by the SCRS in 2017. As such, the Secretariat received feedback from several CPC scientists and presented the revised reduced forms. The Secretariat removed most of the fields that had previously been developed for operational (set-by-set) data submission, maintaining those for aggregated submissions. The Secretariat also noted that the forms needed to be flexible enough to facilitate data submission for a variety of different Species Groups which are caught as by-catch in ICCAT fisheries.

The Sub-Committee discussed that regardless of the work that SCRS might be able to conduct with the reported observer data, the SCRS and the Secretariat have been mandated by the Commission to develop the forms to submit observer data and for CPCs to report such data.

The Sub-Committee discussed if the revised version of the ST09 form was oversimplified as all requested information was at the trip level and detailed information at the set level was lost. There was a general agreement that some information at the set level should be maintained in the form. More specifically the 'number of hooks between floats' that helps to identify shallow and deep sets which could be used as a proxy for targeting. The Sub-Committee agreed that a revised version of the form should include a field to report the number of hooks between floats in ranges and a field with a qualitative definition of the fishing depth (i.e., shallow, medium, deep). It was discussed that the more limited the data is reported, the more limited the utility of these data for the SCRS will be. However, the Sub-Committee reiterated that detailed analyses of the observer data should be conducted by national scientists, who know all the details and caveats of the data, and not by SCRS. As such, the Sub-Committee understood that the need to report very detailed observer information might not be warranted. SCRS could use more aggregated observer data sources when it considers necessary.

The Sub-Committee endorsed the latest version of the ST09 form that incorporated some of the comments provided to the Secretariat (the fields are presented in **Appendix 5**). These forms will be presented to the Sub-Committee on Statistics before being presented to the SCRS plenary for final approval.

Document SCRS/2017/157 proposed new fields to be added to the Port State Measures forms. The Sub-Committee indicated that issues related to Port State Measures are the competence of the ICCAT Compliance Committee and not the SCRS. It was noted that the information that is proposed to be collected can help to assess compliance with the use of mitigation measures adopted by ICCAT.

## 4.2 Status of ST09 observer data received by the Secretariat (report cards)

In 2016, the Sub-Committee on Ecosystems and Statistics discussed that compliance with the submission of observer data using the ST09 forms was very low. As such, the Secretariat was requested to develop "report cards" on submission of this information such as those develop for the other Task I and Task II data. It was noted that this is not as simple a task as the development of report cards for Task I and II data, as observer data is extremely complex and contains multiple dimensions. As a result, submission of an ST09 form may not represent the submission of full observer data. However, the Secretariat cross referenced the

submission of ST09 forms, with the submission of the previously developed CP45 meta-data forms. The purpose of this was to determine which CPCs had stated in their CP45 forms that they collect by-catch data in observer programmes, but did not submit ST09 information. This is also not an ideal process, as it only highlights CPCs that duly submitted CP45 forms, and not those who have submitted no information at all. This new report card is provided in **Appendix 6**.

The Sub-Committee commended the Secretariat for advancing the work related to the mentioned report cards. The Sub-Committee discussed the difficulties in assessing the quality of the reported data using the report cards, but it was also pointed out that this difficulty is also found when assessing other Task II data. The Sub-Committee provided the Secretariat with additional advice that can help to improve the report cards.

## 4.3 Update on EFFDIS estimations

An update to the EFFDIS database was requested by the Sub-Committee on Ecosystems in early 2017. The request was made because general updates in the Task I and II data had become available, and particularly because Japanese historical Task II data had been revised. The Secretariat presented an update of the EFFDIS estimations (SCRS/P/2017/032) with the same methodology previously used (Beare *et al.* 2016). EFFDIS data are made available by the ICCAT Secretariat as the number of hooks reported by the CPCs in the Task II 'Catch-and-Effort' data submission (HooksObs) and the estimated total effort (HooksEst). The estimated total effort is obtained by using Task I (nominal catches) and the Task II 'Catch-and-Effort' data.

The nomenclature used in the final version of EFFDIS has caused some confusion and the Sub-Committee recommended that HooksObs be named HooksReported. It was also noted that in certain cases, the catch available in the Task II data is higher than that in Task I. It was agreed that the Task I catches should always be used for the scaling of the effort as it is the official total catch submission and is likely more accurate than the Task II catches. The current model used to estimate total effort is a GAM from the Poisson family which models -using Generalized Cross Validation- the frequency of hooks (count data). Dependence on time is estimated using 'harmonics'; and on space using (2D-spline) smooth functions. Currently 'variance' is estimated from the Standard Errors of the GAMs. The Sub-Committee recommended using other techniques or strategies to help model-selection (cross validation) and estimate variance (bootstrapping). The code (effdisR) is all written up as a documented R-package, available on request from the ICCAT Secretariat. The Sub-Committee recommended that cross validation of the regression model be conducted. That is because GAMs can over-fit the data. When this happens, the ability of the model to be used as a predicting tool is diminished.

## 5 Sea turtles

SCRS/2017/155 reviewed the historical information on the incidental catch of sea turtle by the Japanese pelagic longline fisheries within the International Commission for the Conservation of Atlantic Tunas (ICCAT) Convention area collected by the Japanese scientific observers. A total of 681 sea turtles were caught on 28 million hooks from eleven thousand fishing operations (sets) observed from 1997 to 2015. The most common species occurred was leatherback (N=312, 45.8%), followed by loggerhead (N=144, 21.1%), and olive ridley (N=76, 11.2%). Species of 149 individuals were unidentified, accounting for 21.9% of total sea turtle by-catch observed. Most of the turtles were caught in the tropical to temperate Atlantic area (10° S to 25° N, area 2) and northern Atlantic (North of 25° N, area 1). In areas 1 and 2, leatherback was the most common species, while olive ridley was the most common in the southern area (10° S to 35° S, area 3). No turtle was recorded from far southern area (South of 35°S, area 4). The areas are also further divided indicating that area 1 and area 4 have vessels fishing "shallow", with 7-13 hooks between floats, and area 2 generally fishing deeper (greater than 14 hooks).

The Sub-Committee inquired why the number of hooks between floats was not included in the results. It was only used to characterize the regions, but it'll be included in the future analyses. The Sub-Committee suggested that the GAMM analysis be conducted for each species separately. It was explained that the analysis was only for leatherback at this time. The Sub-Committee inquired regarding the reason for higher by-catch rate of leatherback recorded in area 1. It was explained that the gear configuration of hooks observed in area 1 was only shallow-set and was only deep-set in area 2, therefore it was unclear whether the area or gear depth effect on the by-catch rate of leatherback. It was also asked which types of bait and

hook were used. This information was not available at this time although the observers record this information. The authors indicated that they have problems regarding species identification for hard shelled turtles in their observer data and this may be the case for other fleets as well. There is a document to identify the species, therefore it may be helpful to solve the problem. The Sub-Committee suggested that the length of the line between floats may be a better proxy for gear depth than the number of hooks per basket, which influences sea turtle by-catch. The Sub-Committee discussed the importance of investigating numerous factors including SST which affect by-catch.

SCRS/2017/141, refers to an ICCAT earlier request from its Standing Committee on Research and Statistics (SCRS) to conduct an assessment of the impact of ICCAT fisheries on sea turtles (ICCAT 2009). Information on the area of operation and estimated fishing effort of 15 longline fleets fishing in the Atlantic in 2012 and 16 fleets in 2013-2014 was obtained from the ICCAT EFFDIS (fishing effort in number of hooks by time-area strata) database. Sea turtle by-catch rates were identified for six fleets operating within the ICCAT Convention area through a comprehensive literature review. For the remaining nine fleets for which data were not available, by-catch rates were assigned based on spatial overlap of fleets with published rates. The total number of sea turtle interactions was estimated using the reported and assigned sea turtle by-catch rates per fleet and multiplied by the estimated total fishing effort deployed by the fleets. The methodology was similar to the one used to estimate the number of sea turtle interactions (all species combined) with pelagic longline gear in the ICCAT Convention area ranged from 30,612 to 47,315 (depending on the by-catch rates used) during 2012-2014. This study is meant to complete the previous work presented in Mckee Gray and Diaz (2017). There was a figure indicating the capture rate of some sea turtle species exceeded that of target species.

The Sub-Committee questioned the high CPUE values for EU-Spain listed in **Table 3** from one of the published CPUE studies and used in the estimates. It was explained that in cases when a range of CPUEs was available, the maximum CPUE was used. The Sub-Committee noted that the numbers would then result in the maximum possible estimations in each case. The Sub-Committee asked how this work would continue, and it was answered that the idea is to insert new data into the current model to get revised estimates. Subsequently it was reminded that large circle hooks and/or the use of fish bait are effective by-catch mitigation measures to reduce sea turtle by-catch and increase post release survivorship, and this information is supported by a large body of literature. The Sub-Committee noted the concern that there is a resulting increase in shark by-catches and reduction of some target species catches (e.g. swordfish). It was also reminded that the SCRS was asked to evaluate the impact on the sea turtle populations and to recommend mitigation measures. The Sub-Committee asked to share scientific papers regarding the effects of large circle hooks and other mitigation measures in order to reduce the knowledge gap. It was also mentioned that circle hook experiments conducted on a deep set bigeye tuna fishery showed no difference in sea turtle by-catch rates between J hooks and large circle hooks, however, since circle hooks caught more tuna, some fisheries have voluntarily adopted their use.

SCRS/2017/150 presented observer records from EU-Spain purse seiners targeting tropical tunas that indicate by-catch of six different sea turtles species in the Atlantic Ocean. Incidental catch rate of sea turtles from the purse seine fisheries occur, but the mortality is very low, and not statistically significant. However, the incidental catch of sea turtles could provide relevant information about the species' distribution. The North Atlantic Oscillation (NAO) is the principal atmospheric oscillation that modulates the trade winds in the North Atlantic Ocean. The principal aim of the present study is to understand the effect of the NAO in the interannual pattern distribution of sea turtle incidental catch by this fishery. The number of total sea turtle records in years with positive NAO phases is significantly higher that the number of sea turtle interactions in years with negative NAO phases.

The Sub-Committee noted that the same individuals may be repeatedly recaptured. It was suggested to conduct mark recapture programmes.

SCRS/P/2017/029 presented a brief overview of sea turtle conservation measures adopted by some other RFMOs. The first measure that was adopted in ICCAT was in 2003. Currently, most include implementation/requirement of a combination of following "FAO Guidelines" for safe handling and release of sea turtles, continued research into mitigation techniques, provision of educational information to fishers, and reporting interaction data to scientific committees. However, few measures mandate specific actions to mitigate sea turtle interactions. The IOTC encourages annual reviews of data, use of finfish as bait

and a reporting requirement for turtle interaction in net fisheries. In the WCPFC, conservation measures for longline vessels that fish for swordfish in a shallow-set are required to employ or implement at least one of the following three methods to mitigate the capture of sea turtles:

1) Use only large circle hooks, which are fishing hooks that are generally circular or oval in shape and originally designed and manufactured so that the point is turned perpendicularly back to the shank. These hooks shall have an offset not to exceed 10 degrees; 2) use only whole finfish for bait; or 3) use any other measure, mitigation plan or activity that has been reviewed by the Scientific Committee and the Technical and Compliance Committee.

A discussion included clarification on the situation about IOTC, which has a significant problem regarding sea turtle by-catch in gillnet and driftnet fisheries. In addition, the Sub-Committee reviewed the *Recommendation by ICCAT on Management Measures for the Conservation of Atlantic Sailfish* [Rec. 16-11], regarding marlins and sailfish, which recommended encouraging or requiring the use of circle hooks. The Sub-Committee discussed that any recommendation should include flexibility with regards to choice of mitigation method (e.g. select from some options) similar to WCPFC.

## 6 Seabirds

## 6.1 Feedback on GEF-ABNJ seabird mitigation meeting and ICCAT collaborative work meeting

SCRS/2017/158 provided an update on the seabird component of the Common Oceans Tuna Project and was presented on behalf of participants of two regional pre-assessment workshops on seabird by-catch.

The need to continue to maintain linkages and share information between this work and the Sub-Committee was noted, as was the capacity building element of the project. The Sub-Committee was informed that for the upcoming pre-assessment data meeting (20-24 February 2018, Mexico) by-catch data will be compiled and then basic data analysis will be conducted to begin the process of aligning datasets and understanding commonalities.

SCRS/P/2017/033 reported on collaborative work to assess seabird by-catch in the pelagic longline fleets operating in the South Atlantic and Indian Oceans.

Given the similarity of the ultimate objectives of the two above mentioned concurrent processes, the Sub-Committee emphasized the importance of harmonising efforts and linkages between these complimentary processes.

## 6.2 Review of progress on seabird interaction estimations and mitigation

Document SCRS/2017/152 presented results of Japanese research investigating the effect of longline setting time on the catches of target and by-catch species. The study made use of data collected by the Japanese Observer Programme from vessels fishing South of 25°S from 2011 to 2013.

The Sub-Committee noted that setting lines during the darkness of night significantly reduces seabird bycatch, and thus represents an effective by-catch mitigation measure. The daily pattern of by-catch rate varied between species. The patterns of catch rate of target fish species among setting times varied among species. However, it was noted that the study did not consider soak time, and for some species catches were low, and so this aspect of the study should be considered preliminary. The Sub-Committee suggested to present the result in relation to nautical dawn, rather than sunrise, as the night setting conservation measure for seabirds requires setting to be started and finished during the hours of darkness, between nautical dusk and nautical dawn and the author explained that the time was adjusted to sunrise rather than nautical dawn for biological reasons. The Sub-Committee noted that the study highlighted the value of using set-by-set operational data, and suggested that the authors consider using a GAMM analysis to investigate further the effect of moon phase on the catch rates of seabirds. Document SCRS/2017/167 presented a preliminary estimation of seabird bycatch numbers by Chinese Taipei longline vessels in the southern Atlantic Ocean from 2002 to 2016. The paper updates a previous analysis, and makes use of observer data collected from 60 Chinese Taipei–tuna longline vessel trips operating in the South Atlantic during this period. By-catch estimates were higher South of 35°S, especially in the southwest and southeast Atlantic, and between February and July.

The Sub-Committee noted that by-catch estimates of total mortality peaked in 2008, and have decreased since 2013. The possible reasons for the decreasing trends in by-catch estimates need to be further explored, but may be influenced by decreasing effort, levels of observer coverage, experience of observers and captains, and the use of mitigation measures, amongst other factors. The Sub-Committee welcomed the report that there has been an improvement in recent years in the quality of the data collected and reported by the observer programme, and agreed that this should lead to a better understanding of by-catch associated with this fleet. The Sub-Committee provided some suggestions for further investigations, including how the proportion of fishing effort has changed over time in relation to the area South of 35°S, an assessment of the effectiveness of mitigation measures and other factors that contribute to by-catch and by-catch reduction.

Document SCRS/2017/154 presented Japanese research efforts which aimed to understand the effectiveness of seabird by-catch mitigation techniques. The study presented results of at-sea trials conducted during April and May in 2014 and 2015 in the North Pacific to assess the effectiveness of the following measures: i) hybrid tori line, ii) 40g Lumo lead placed at the hook, iii) 34g blinking weight placed at the hook and iv) 34g blinking weight placed 30cm from the hook. In total, 27 longline fishing operations were observed in the study, and the seabird attack rates of the baited hooks and by-catch events for the two major by-catch species, Laysan albatross *Diomedea immutabilis* and the black-footed albatross *Diomedea nigripes*, were recorded.

The Sub-Committee noted that the attack and by-catch rates of these species did not differ significantly across the four mitigation gears. The Sub-Committee noted the high seabird by-catch rate observed in the study. The author explained that at-sea trials were done in areas where seabirds were abundant in order to maximise the likelihood that the experiment would detect differences among mitigation measures. It was suggested that the researchers investigate further the reasons for the number of birds caught, and how this might be addressed.

Document SCRS/2017/156 presented an analysis of tracking data for four procellariform seabirds from South Georgia (wandering albatross, black-browed albatross, grey-headed albatross and white-chinned petrel), and the calculated overlap of tracked birds with pelagic longline fisheries in the southern Ocean for the period 1990-2009. The analysis made use of an extensive tracking dataset, which includes all major life-history stages, as well as long-term demographic data from Bird Island, South Georgia.

The Sub-Committee noted the importance of the southern portion of the ICCAT Convention area for South Georgia albatrosses. The Sub-Committee discussed the methodology used in the study, including the different life history categories used and the representativeness of counts of breeding pairs as a proxy for total population abundance. The Sub-Committee noted that all four populations have experienced long-term declines and that there was a high degree of inter-annual variability in the numbers of birds breeding at Bird Island, especially for grey-headed albatrosses. The author explained that this variability was due largely to the biennial breeding pattern of this species (where birds breed every other year), compared to the annual breeding pattern of black-browed albatrosses. Given the lack of evidence for any land-based threats (such as introduced predators and human disturbance) and disease, these declines have been attributed to factors affecting birds at sea, and in particular by-catch associated with commercial fishing operations.

It was noted that historically high by-catch of seabirds in fisheries operating around South Georgia have been reduced to negligible levels following the introduction and use of a suite of by-catch mitigation measures. The residual threat is considered to be from more distant fisheries, particularly during the nonbreeding period when birds range more widely. It was also noted that work is underway to understand the respective roles of by-catch and climate change in driving these population trends. The Sub-Committee recognised that because of the long-lived nature of albatrosses, populations may not show rapid recovery following a reduction in threats. Counts of breeding birds at colonies provide an assessment of only one component of the population. Consequently, links between population trends and threats, such as by-catch, and the efficacy of by-catch mitigation measures, should be interpreted with caution. The Sub-Committee noted that large-scale overlap of average seabird distribution with fishing effort doesn't necessarily equate to seabird mortality. In addition, the risk of by-catch depends on how each species and life-history stage behaves or interacts with the vessel. The overlap analysis highlights areas of potential risk, and should be complemented by fine-scale tracking and by-catch data to better understand the nature and extent of by-catch.

Document SCRS/2017/151 presented results of research which investigated whether bill length can be used to distinguish species in the wandering albatross complex: *Diomedea exulans, D. dabbenena, D. antipodensis gibsoni* and *D. antipodensis antipodensis.* The identification of species based on bill length measurements were compared with those using molecular approaches (DNA analysis), and were found to be in complete agreement. Based on this result, the Japanese observer programme has introduced bill length measurements protocols to facilitate species identification.

The Sub-Committee agreed that the outcomes of the research provide a valuable tool to help overcome seabird identification challenges. The Sub-Committee commended Japan for its efforts to address this issue, and for including the tool into their observer programme.

SCRS/P/2017/035 provided information on a scientific survey to assess seabird abundance in Mauritanian waters.

The Sub-Committee noted that the majority of species of seabirds are migratory coming from European waters and that there is a significant concentration in the vicinity of Cape Blanc. As there is also a great deal of fishing activity in the region this would justify the need to initiate by-catch mitigation measures. It also appears that there is by-catch of birds by foreign vessels in Mauritanian waters and it was noticed that a vessel was found to have frozen seabirds on board for reasons that were unclear.

## 6.3 Seabird by-catch and mitigation in the Mediterranean

Document SCRS/P/2017/018 summarized the data on seabird by-catch obtained from the onboard observer programme of the *Instituto Español de Oceanografía* (IEO) between 2000 and 2016.

The Sub-Committee noted that the increasing trend of by-catch reported may be explained by increasing observer coverage. The Sub-Committee noted that estimates of total seabird by-catch based only on nominal BPUEs should be treated with caution due to the combination of high zero catch sets and very few sets with high seabirds catches. The Sub-Committee discussed the methods to improve these estimates, using similar approaches that were presented for other fleets.

The Sub-Committee was informed of a planned new phase of ACCOBAMS-MAVA-GFCM by-catch work from 2017-2020, which includes: a Mediterranean-wide by-catch database to be held by GFCM; trials of mitigation gear for reducing multi-taxa by-catch for gillnets, trawl and demersal longlines; the creation of a by-catch advisory group; and the development of a Mediterranean-wide gap analysis and an associated strategy for by-catch work.

Document SCRS/P/2017/019 summarized the data on seabird direct mortality from the onboard observer programme of IEO from 2009 to 2016.

The Sub-Committee considered the short time series of data available, thereby limiting interpretation. The authors propose to continue with the ringing programme.

The Sub-Committee recalled the recommendation from this Sub-Committee in 2016 to conduct a regional workshop with the goal of recovering catch and by-catch information in gillnet fisheries. This has been approved by the Commission so funds are available and dates and details need to be confirmed to conduct the workshop.

## 6.4 Response on the effectiveness of seabird mitigation measures as per Rec. [11-09]

The Sub-Committee recalled that the paucity of seabird by-catch data submitted to the ICCAT Secretariat after the implementation of mitigation measures has prevented the assessment required by Rec. 11-09. Nevertheless, the Sub-Committee acknowledged that several intersessional initiatives have been advanced (as reported in section 6.1) to address this Rec. [11-09]. Collaborative work is currently being undertaken by ICCAT CPC national scientists who have started to analyze seabird by-catch data from detailed operational level observer data, which should facilitate the advancement of the required assessment. Additionally, the Common Oceans Tuna project has an ongoing global seabird assessment that can also provide additional information for the ICCAT Convention area. It is expected that more national scientists with knowledge of longline fisheries operating in areas South of 25°S will participate in the collaborative initiative undertaken by ICCAT CPC scientists.

## 7 Fish species caught as by-catch but not considered by other Species Groups

SCRS/P/2017/031 provided information on the by-catch issues in the French Mediterranean longline fisheries and in particular the first output of a collaborative research project.

The Sub-Committee asked why the fishermen were unwilling to use tori lines during the trial. It was expressed that the fishermen in the study use mostly small boats, and the use of tori lines is not practical. Also, as the interactions with birds are highly seasonal, the fishermen did not want this equipment on the boat.

SCRS/P/2017/036 provided information on the Namibian large-pelagic sampling programme and possible seismic impacts.

The Sub-Committee welcomed the work being conducted by Namibia. It was noted that the spatial information provided for by-catch would need to be corrected using the original logsheet data, as the sign and decimals in the spatial information presented were not included, resulting in erroneous plots of the catch data.

A presentation on an update on post-release survival of tagged whale shark encircled by tuna purse-seiner was provided in document SCRS/2017/147.

There was no confirmed post release mortalities. The Sub-Committee noted that most of the tags deployed in 2016 detached after a week or less, whereas those deployed in 2014 stayed on longer. It was queried whether this could have been due to tag failure. It was clarified that it was due to animal behaviour (deep diving) as the data from the tags are intact and clearly indicate this behaviour.

SCRS/2017/159 provided a study on elasmobranch by-catch in the French tropical purse-seine fishery of the eastern Atlantic Ocean.

The authors stated their willingness to collaborate with other CPCs to improve this study, especially with their EU-Spain colleagues due to the similarity in fishing operations and areas. The Sub-Committee welcomed this study particularly in light of the fact that few by-catch studies on purse seine fisheries have been presented to the Sub-Committee. It was encouraged that this presentation be made again at the next meeting of the Sharks Working Group.

SCRS/2017/165 provided a study on using FADS to estimate a population trend for the oceanic whitetip shark in the Atlantic Ocean.

The Sub-Committee made some technical suggestions to improve the estimations in the study, including to remove spatial cells where no encounters have ever been recorded, as this will reduce the zero-inflation problem and the corresponding variance. This would need to be tested to see if it is justifiable. It was observed by the Sub-Committee that as the effort of the fishery expanded South, the encounters with OCS appear to decrease. The Sub-Committee discussed whether there is currently enough confidence in the results to make conclusions about the decline of the oceanic whitetip shark population. It was suggested that the declining trend in encounters could be due to a spreading of effort across an expanding fishing area or other factors that were not considered, rather than an actual population decrease. There were differing opinions on this issue and further studies are required to clarify this problem.

The Secretariat presented **Table 2** containing the Task I catches of non-target species often not taken into consideration. The list was comprised largely of teleost species not categorised under the main/small tuna or shark categories. It was noted that several of these species have a relatively high economic value and are thus desirable for retention. The Sub-Committee considered that it is important to collect the catch data of these non-target species and then review their roles in the pelagic ecosystem. CPCs are therefore strongly encouraged to continue or initiate the submission of Task I information for these species.

## 8 Other matters

# 8.1 Review mechanisms to integrate the activities of the Sub-Committee on Ecosystems with those of the Species Working Groups. Consider the Committee's role within the SCRS and how to effectively coordinate, integrate and communicate ecosystem-relevant research across the ICCAT Species Working Groups and within the SCRS

The Sub-Committee discussed its role and its relationship to the Species Groups. It was recognized that the Sub-Committee has a broad mandate and no established mechanism to communicate and engage the Species Groups on which it relies. It was noted that a positive move towards resolving these issues would be to have annual meetings of the officers of the SCRS during the week of Species Working Group meetings, and develop an executive summary to include in the SCRS annual report on the state of the ecosystem components supporting ICCAT fisheries.

## 8.2 Discuss the information required to evaluate mitigation efforts for by-catch species

A presentation was provided entitled "Statistical consideration on sea-bird mitigation measure evaluation". This presentation was previously introduced at CCSBT (CCSBT-ERS/1703/27).

The Sub-Committee noted the statistical challenges and problems associated with interpreting rare occurrence events such as seabird by-catch. The Sub-Committee recognised that it is important to account for non-independence of set by set data within the same trip. Differences in seabird by-catch rates among vessels may assist to assess the effectiveness of mitigation measure implementation. The Sub-Committee recalled the relevance of Domingo *et al.* (2015) on the species richness encountered by pelagic longliners, and noted that there may be examples from other taxa and fields where analyses account for rare or other extreme/infrequent events. The Sub-Committee agreed that the challenges associated with using Birds-Per-Unit-Effort to estimate total mortality should be further investigated. The presenter reported that the Vietnam regional pre-assessment workshop of the Common Oceans Tuna Project discussed the statistical issues, and intend to consider it further during the course of the Project. It is hoped that this process will help to develop a better analytical approach to overcome these challenges.

## 9 Recommendations

## 9.1 General recommendations

## By-catch

- The Sub-Committee requests that CPCs continue or initiate the submission of Task I information for non-target teleost species not categorised under the main/small tuna or shark categories (e.g. oilfish, escolar, Atlantic pomfret, etc.).
- The Sub-Committee acknowledges that large circle hooks are proven to be effective in reducing sea turtle by-catch and might also increase post-release survival. The Sub-Committee also acknowledges that circle hooks have different impacts on both target and by-catch species. While they decrease marlin by-catch and swordfish catch rates, they increase tropical tuna and sharks catch rates.

Taking into consideration the above scientific information, and that most sea turtle by-catch occurs on shallow longline sets, the Sub-Committee recommends the Commission to consider adopting for longline fisheries targeting swordfish and sharks at least one of the following mitigation measures:

- 1. the use of large circle hooks
- 2. the use of finfish bait
- 3. other measures considered effective by the SCRS.
- The Sub-Committee encourages national scientists to evaluate the overall impact of adopting mitigations measures on the management of the large pelagic fish community.
- The Sub-Committee recommends that the Working Group on Stock Assessment Methods review the method used to update the EFFDIS estimates and provide advice on potential improvements.

## Ecosystems

- It is recommended that the next meeting of the Dialogue between Scientists and Managers Working Group (SWGSM) include an agenda item on the development of Ecosystem Report Cards to support the implementation of an EBFM framework for ICCAT.
- It is recommended that in future Species Working Group meetings there be a meeting between the Working Group chairs and the Ecosystem Sub-Committee Conveners in order to discuss ecosystem related issues.
- Given the need to communicate the status of the unassessed and non-retained species caught by ICCAT fisheries as well as other components of the ecosystem that play a role in supporting the fisheries, the Sub-Committee recommends that the SCRS include an Executive Summary of the outcomes of the ecosystem assessments in the annual report of the SCRS.

## 9.2 Recommendations with financial implications

## By-catch

- The Sub-Committee requests financial assistance to support the attendance of three to five CPC scientists during the seabird assessment process of ICCAT.

## Ecosystems

 Given the large amount of work involved in implementing ecosystem based fisheries management in ICCAT and implementing related products such as Ecosystem Overviews, Ecosystem Assessment Reports and Ecosystem Report Cards, the Sub-Committee recommends that 20,000 Euros of financial assistance be provided to support an external contractor to expedite this process.

## 10. Adoption of the report and closure

The report was adopted during the meeting. The Conveners thanked all the participants and the Secretariat for their hard work.

The meeting was adjourned.

## Appendix 1

## Agenda

- 1. Opening, adoption of Agenda and meeting arrangements
- 2. EBFM
  - 2.1 Review the progress on developing an Ecosystem Report Card for ICCAT and review potential status and pressure indicators, reference levels and management actions for elements of ICCAT's EBFM framework and any progress on developing new indicators for all ecological components of ICCAT's EBFM framework (i.e. target species, by-catch, habitat and trophic relationships)
  - 2.2 Review the proceedings of the joint meeting between tRFMOs on the implementation of the EBFM approach
- 3. Ecology and Habitat
  - 3.1 Review information on the trophic ecology and habitat of pelagic ecosystems that are important and unique for ICCAT species in the Convention area.
- 4. Data used for by-catch analyses
  - 4.1 Revision and update of ST09 forms
  - 4.2 Status of ST09 observer data received by the Secretariat (Report cards)
  - 4.3 Update on Effdis estimations
- 5. Sea Turtles
- 6. Seabirds
  - 6.1 Feedback on GEF-ABNJ seabird mitigation meeting and ICCAT collaborative work meeting
  - 6.2 Review of progress on seabird interaction estimations and mitigation
  - 6.3 Seabird by-catch and mitigation in the Mediterranean
  - 6.4 Response on the effectiveness of seabird mitigation measures as per Rec [11-09]
- 7. Fish species caught as by-catch but not considered by other species groups
- 8. Other matters
  - 8.1 Review mechanisms to integrate the activities of the Sub-committee on Ecosystems with those of the species Working Groups. Consider the committee's role within the SCRS and how to effectively coordinate, integrate and communicate ecosystem-relevant research across the ICCAT Species Working Groups and within the SCRS.
  - 8.2 Discuss the information required to evaluate mitigation efforts for by-catch species.
- 9. Recommendations
  - 9.1 General recommendations
  - 9.2 Recommendations with financial implications
- 10. Adoption of the report and closure

## **Appendix 4**

## SCRS Documents and Presentations Abstracts – as provided by the authors

*SCRS/2017/140* - To facilitate the implementation of Ecosystem-Based Fisheries Management in the ICCAT Convention area, the Sub-Committee on Ecosystems recommended the development of an indicator-based ecosystem report card. The main purpose of the ecosystem report card is to improve the link between ecosystem science and management and increase the awareness, communication and reporting of the state of ICCAT's different ecosystem components to the Commission. Here, we first aim to initiate a discussion and make the case for the need and usefulness of an indicator-based ecosystem report card. Second, we provide a potential template of an ecosystem report card to contribute on the process towards its full development and use. Third, we calculate several ecosystem indicators to test its utility and identify potential challenges and opportunities for their development. We calculated an integrated multispecies B/BMSY and F/FMSY ratio, which we use to monitor the status of ICCAT assessed stocks at several spatial and taxonomic scales. Continuing the development and refinement of the report card with the involvement of a diverse group of experts including scientist, managers and other key stakeholders will be pivotal to improve its utility and relevance to the management of tuna and tuna-like species and associated ecosystems in the Atlantic Ocean.

*SCRS/2017/141* - In 2010, the International Commission for the Conservation of Atlantic Tunas (ICCAT) requested its Standing Committee on Research and Statistics to conduct an assessment of the impact of ICCAT fisheries on sea turtles (ICCAT 2009). Information on the area of operation and estimated fishing effort of 15 longline fleets fishing in the Atlantic in 2012 and 16 fleets in 2013-2014 was obtained from the ICCAT EFFDIS (fishing effort in number of hooks by time-area strata) database. Sea turtle bycatch rates were identified for 6 fleets operating within the ICCAT Convention area through a comprehensive literature review. For the remaining 9 fleets for which data were not available, bycatch rates were assigned based on spatial overlap of fleets with published rates. The total number of sea turtle interactions was estimated total fishing effort deployed by the fleets. The total number of sea turtle interactions (all species combined) with pelagic longline gear in the ICCAT Convention area ranged from 30,612 to 47,315 (depending on the bycatch rates used) during 2012-2014. This study completes the previous work presented in document SCRS/2016/125.

*SCRS/2017/147* - In the tropical eastern Atlantic Ocean, whale sharks are sometimes encircled by nets of tropical tuna purse-seiners. In order to estimate the post-release survival of encircled individuals, a post release survival experiment, using pop-up satellite tags, was conducted in this ocean in 2014. This study presents updated results from this experiment. In addition to the six (five included in the study and an individual from Murua et al. 2014) whale sharks tagged in June–July 2014, five other individuals were tagged in June 2016. Among these 11 tags, seven individuals survived at least 21 days after release, three tags detached after 3 and 7 days and the fate of these individuals remains unknown, and one tag failed to report. Although the sample size remains limited, the results indicate a post release mortality rate following encirclement of large whale shark of 0%. Nevertheless, there remains an urgent need to increase post-release tagging experiments of whale shark encircled by purse-seine nets to estimate the survival rate and to define, if needed, regulatory measures to protect this shark species..

*SCRS/2017/148* - This paper provides information on aspects of the ecology of squid and their importance in the pelagic trophic web of the northwest Atlantic including the Sargasso Sea. The majority of the global squid catch comprises species from two families, the Ommastrephidae and Loliginidae. In the northwest Atlantic, two species of squids are commercially exploited: Northern shortfin squid *I. illecebrosus* (Ommastrephidae) which is an oceanic species and the longfin squid *Doryteuthis* (*Loligo*) *pealeii* (Loliginidae) which is a neritic species. The populations of both of these species are strongly influenced by the Gulf Stream, a powerful western boundary current system. Most squid species have life spans of a year or less and, as a consequence, their populations often display irregular annual fluctuations in abundance as opposed to cyclical patterns. Squids are considered to be sensitive to environmental factors and these factors may strongly influence recruitment and early growth. As squids function as both predator and prey, they play an important role in the trophic web of pelagic ecosystems. Studies of stomach contents demonstrate that Ommastrephidae are major contributors to the diets of large pelagic fishes in the central north Atlantic and all five tuna species (Thunnidae) plus swordfish (*Xiphias gladius*) managed by ICCAT have squid as an integral prey group in their diets. As squids are essentially "annual" species and are highly responsive to changes in their environment, it may be possible to use squids as a "sentinel" group with respect to climate change. The evidence presented here shows the importance of squid species in pelagic ecosystems and the need to incorporate data on these species into any ecosystem-based fisheries management (EBFM) model for tuna and tuna-like species in the northwest Atlantic including the Sargasso Sea.

*SCRS/2017/150* - Observer records from Spanish purse seiners targeting tropical tunas indicate by-catch of six different sea turtles species in the Atlantic Ocean. Incidental catch of sea turtle from the purse seiners fisheries targeting tropical tunas occur, but the mortality is very low, and not significant. However, the incidental catch of sea turtles could provide relevant information about the species' distribution. The North Atlantic Oscillation (NAO) is the principal atmospheric oscillation that module the trade winds in the North Atlantic Ocean. The principal aim of present study is understanding the effect of the NAO in the interannual pattern distribution of sea turtle incidental catch by this fishery. The number of total sea turtle records in years with positive NAO phases is significantly higher that the number of sea turtle interactions in years with negative NAO phases.

*SCRS/2017/151* - To understand the potential impacts of bycatch on populations, it is important to identify animals to species level. This includes individuals within the wandering albatross species group, *Diomedea exulans, D. dabbenena, D. antipodensis gibsoni* and *D. antipodensis antipodensis,* which overlap in their atsea distributions. In our study, species was determined initially for bycaught birds in this group from bill length measured in the lab. These identifications were then compared with those from molecular methods (DNA analysis). Results were in complete agreement, and it was suggested that the bill length method has the potential for application in the Japanese and, by inference, other observer programs. Indeed, we report this method has now been introduced as standard in the Japan Observer Program.

*SCRS/2017/152* - Hourly catch rate pattern of seabirds, tuna, shark and other fish species were estimated by the data collected by longline observers in relation to the time of sunrise, to investigate the effect of time zone of longline gear setting the relative timing of gear setting to the sunrise on the catches of target and bycatch species. Catch rates of seabirds caught by hooks deployed before the sunrise were in rather low level or zero. The setting time from sunrise affected to seabird bycatch occurrence rate and that effect was stronger than those of area and lunar phase effect. As a result, the night setting would very effective for seabird mitigation. The results obtained from catch rate of fish species indicated that efficient setting operation timing varied between target species.

*SCRS/2017/154* - In this study, seabird attacking behavior toward branchline bait and bycatch rate under use of three weighted branchline designs (LUMO leads, and Blinking weights fixed at 30cm apart from hooks and Blinking weights fixed just upon hooks) were compared with that of a hybrid tori-line by the experimental longline operations to evaluate effectiveness of these gears as seabird bycatch mitigation gears. During research cruises in 2014 and 2015, 27 longline had been set around the Northwest Pacific and 50 albatrosses had been caught. All branchline designs had exhibited similar effect to tori-lines about reduction of attacking rate and bycatch rate but blinking weight tended to be less effective when it placed apart from hook.

*SCRS/2017/155* - The document reviewed the historical information on the incidental catch of sea turtle by the Japanese pelagic longline fisheries within the ICCAT Convention area collected by the Japanese scientific observers. A total of 681 sea turtles were caught with the 28 million hooks of eleven thousand fishing operations observed from 1997 to 2015. The most common species occurred was leatherback (N=312, 45.8%), followed by loggerhead (N=144, 21.1%), and olive ridley (N=76, 11.2%). Species of 149 individuals were unidentified, accounting for 21.9% of total sea turtle bycatch observed. Most of the turtles were caught in the tropical to temperate Atlantic (100 S to 250 N, area 2) and northern Atlantic (North of 250 N, area 1). In the areas 1 and 2, leatherback was the most common species, while olive ridley was the most common in the Southern area (100 S to 350 S, area 3). No turtle was recorded from far southern area (South of 350 S, area 4).

*SCRS/2017/156* - This paper presents an analysis of tracking data for 4 procellariiform seabirds from South Georgia, and calculates overlap with pelagic longline fisheries in the Southern Ocean for the period 1990-2009. We used an unusually comprehensive tracking dataset from all major life-history stages (including juvenile stages), weighted according to the proportion of the population they represented (based on demographic models), in order to generate population-level distributions by month. This analysis confirms that the ICCAT area is important for all species, with hotspots of overlap with fisheries in the Brazil-Falklands Confluence region and in the southeast Atlantic, from Tristan da Cunha east to the Benguela Upwelling. Overlaps were particularly high for Japan and Chinese Taipei, and to a lesser extent South Korea, Namibia and Brazil. Black-browed albatrosses had the highest index of overlap with fisheries in the Atlantic, and for all species, overlap was highest during winter months (May–September; when fishing effort south of 30°S is greatest). The areas identified here largely match areas where high rates of bycatch have been recorded, emphasizing the need for use of bycatch mitigation measures.

*SCRS/2017/157* - This paper highlights the importance of expanding the sources of data on implementation of seabird bycatch mitigation measures via port inspection. The planned review of the effectiveness of Rec. 11-09 on seabird bycatch has been severely hampered by a lack of data, and the requirement to conduct an update assessment of the effectiveness of the mitigation measures by 2015 has not been met. Recognising that ICCAT has an ICCAT scheme for minimum standards for inspection in port (Rec. 12-07), the addition of elements relevant to seabird bycatch to this scheme would provide a valuable supplementary data source on the nature and extent of the use of various measures mandated under Rec. 11-09, through limited additional effort. Such an approach would be complementary to existing data sources and would not replace them. We make suggestions of the data fields that could be used in ICCAT port inspection forms, and highlight the need for inspector training and materials to support such an approach.

*SCRS/2017/158* - This paper provides the outcomes of two Regional Seabird Bycatch Pre-assessment Workshops held in early 2017, together with some explanatory background. An agreed next step is that a data preparation workshop, along the lines of stock assessment workshops and CPUE standardisation processes, should be held in February 2018. Further, intersessional work before and after the data preparation workshop is highly desirable. The scale of this evaluation effort will be limited to the Southern Hemisphere.

*SCRS/2017/159* - Marine megafauna, especially sharks and rays, are caught as bycatch by the tropical tuna purse-seine fishery. We studied their spatio-temporal distribution patterns by species and by the diversity of assemblages, as well as by differentiating juveniles and adults in the eastern Atlantic Ocean. We also studied sex-ratios and mortality rates at release. The data analyzed were collected by scientific observers onboard French purse-seiners between 2005 and 2017. Among the 18 species of elasmobranches caught, 85.4% of the individuals were silky sharks. Distributions of catch per unit of effort (CPUE) by species, sexratios and diversity indices varied with life stages, areas, seasons and fishing modes (fish aggregating device vs. free-swimming tuna school sets). These differences appear to be linked to specific environmental conditions occurring in some areas and seasons. Higher elasmobranches catch rates in FAD sets (40%) compared to FSC sets (17%) were detected. Overall, this study highlights high elasmobranches bycatch rates, high mortality rates for most species (12.76–56.93%; average 45.8%), and high proportion of juveniles caught for the large majority of species (21.27–100%; average 87.4%).

*SCRS/2017/160* - A single Ecological Niche model was developed for skipjack tuna (SKJ) in the Eastern Central Atlantic Ocean (AO) and Western Indian Ocean (IO) using data from the European purse seine fleet (fig. 1). Chlorophyll-a fronts were used as proxy for food availability while selected physical variables defined the abiotic preferences. SKJ feeding habitat spanned from latitudinal occurrence of eddy-type productive features at mesoscale in the IO to large-scale upwelling systems that seasonally shrink and swell in the AO (fig. 2). About 83% of FSC sets and 75% of dFAD sets were done within 25 km distance of preferred habitat while, in the AO, 34% of dFAD sets occurred at distances greater than 100 km (fig. 2a), mostly in the relatively food-poor Guinea Current, which is questioned to correspond to a spawning and larvae favourable area. Results emphasized higher SKJ accessibility to purse seiners in months when the habitat is reduced (fig. 3). Moreover, the positive correlation found in the IO between the annual size of preferred habitat and both the annual nominal catch rates and total catches of SKJ (fig. 4) i) agrees with the near full exploitation since the 2000s for the IO and in recent years for the AO, and ii) suggests interpreting the habitat size as an indicator of the carrying capacity of this fast-reproducing species.

*SCRS/2017/165* - Count data of oceanic whitetip sharks (*Carcharhinus longimanus*) associated with Fish Aggregating Devices (FADs) were used to derive a population trend for the species in the eastern Atlantic Ocean. Observer data from the French and Spanish purse seine fleets were used in the analyses. The combined time series spanned from 1995 to 2015 and was divided into historic (1995-2003) and recent years (2004-2015). The time series division was based on the evolution of the FAD fishery in the Atlantic Ocean and the substantial increase of the number of FAD sets as from 2004 was considered a key factor. The estimated population abundance index ( $\lambda$ ) for the historic period was approximately two times higher than the recent, dropping from 0.5674 to 0.2935. Results indicate a declining population trend for the oceanic whitetip shark in the eastern Atlantic Ocean.

*SCRS/2017/167* - Bycatch by longline fisheries is one of the major threats to some species of seabirds and albatross. This research collected observer data from 60 Taiwanese tuna longline vessel trips operating in the Southern Atlantic Oceans between 2002 and 2016. In total, two thousand and ninety nine seabirds were incidentally caught. Among them, 57.9% were albatrosses, including black-browed, yellow-nosed, wandering, and sooty albatrosses. Other seabird included white-chinned petrel, great shearwater and others. There were limited seabird bycatch in the north of 25° S. The bycatch number ranged from 0 to 68 birds per set. The bycatch rates were higher in the south of 35° S, between 2008 and 2013, and during major fishing seasons (February to July). The estimated seabirds mortality was higher in 2008 and decreased in recent years.

*SCRS/P/2017/018* - This presentation summarized the data on seabird bycatch obtained from the on board observer programme of the Instituto Español de Oceanografía (IEO) between 2000 and 2016. During this period five seabird species dominated the catches, four breeding species and one species wintering in the area. The catches occured mainly along the continental shelf, with a major incidence in the Ebro delta and around the Balearic Islands. Most of the catches occur during breeding and migratory seasons, and 95% of seabird bycatch occurs in home based longline targeting swordfish (LLHB) and drifting longline targeting albacore (LLALB)

*SCRS/P/2017/019* - This presentation summarized the data on seabird direct mortality from the onboard observer programme of IEO from 2009 to 2016. The document presents a pilot program for banding/ringing seabirds captured by the Spanish longline fishery in order to estimate post-release mortality. Since 2009, 1068 seabirds have been reported as bycatch in drifting longline fishery by the IEO-Observer programme. About 52% of those seabirds died, 37% were released alive and the fate of the remaining 11% were unknown. The 2016 ringing program began in December, since then 6 seabirds have been ringed and released alive, and one bird was recaptured.

*SCRS/P/2017/024* - A method for developing distinct geographical subunits using the existing spatial of the Task I and Task II data was described. This led to the creation of 5 areas for which it was shown that indicators could be developed. It is noted that much of the content is available on which to base both Ecosystem Assessments and Report Cards for these regions and that much of the data is online allowing some of the work to be programmed. These documents are expected to provide a useful context for the single species stock assessment and can yield an overall view of management performance. Furthermore, regular ecosystem reports will help to improve the accessibility and quality of the data on which they are based. In the short term it will be necessary to agree on a format and the content for the report cards, consistent with EBFM framework, and to engage managers in developing the content they feel would be relevant.

## *SCRS/P/2017/025* - No abstract available

*SCRS/P/2017/028* - Advancing towards ecosystem base management requires linking species ecology and environment. Fluctuations in oceanographic conditions have a wide range of effects on species ecology that should be consider during both assessment and management. Here we present current advances from a multidisciplinary joint research initiative linking tuna species ecology and operational oceanography. The analytical approach of this initiative is based on three main tasks: 1) Investigate tuna environmentally driven traits, 2) develop indicators for identified environmental processes (operational oceanography tools) and 3) apply the developed indicators to improve assessment of tuna species. The different studies developed are supported by the combination of biological data (larval surveys, fisheries data and rearing experiments) and operational oceanography products coming from hydrodynamic models, remote sensing and in situ data (CTD; gliders; lagrangian platforms; fixed stations). The operational products develop provide information on variability of oceanographic processes driving tuna ecology traits, distribution of spawning and larval habitats, larval abundance indices and survival.

*SCRS/P/2017/029* - presented a brief overview of sea turtle conservation measures adopted by some other RFMOs. The first measure that was adopted in ICCAT was in 2003. Currently, most include implementation/requirement of a combination of following "FAO Guidelines" for safe handling and release of sea turtles, continued research into mitigation techniques, provision of educational information to fishers, and reporting interaction data to scientific committees. However, few measures mandate specific actions to mitigate sea turtle interactions. The IOTC encourages annual reviews of data, use of finfish as bait and a reporting requirement for turtle interaction in net fisheries. In the WCPFC, conservation measures for longline vessels that fish for swordfish in a shallow-set (not prescribed) are required to employ or implement at least one of the following three methods to mitigate the capture of sea turtles:

1) Use only large circle hooks, which are fishing hooks that are generally circular or oval in shape and originally designed and manufactured so that the point is turned perpendicularly back to the shank. These hooks shall have an offset not to exceed 10 degrees; 2) use only whole finfish for bait; or 3) use any other measure, mitigation plan or activity that has been reviewed by the Scientific Committee and the Technical and Compliance Committee.

SCRS/P/2017/030 - Several international instruments have set the minimum standards and key principles to guide the implementation of an ecosystem approach for the management and conservation of marine living resources. The ICCAT resolution 15-11 and the 2015-2020 SCRS Science Strategic Plan have also established the main objective of advancing ecosystem based fisheries management to provide advice to the Commission. Yet these aspirations have not provided practical guidance on how to make operational an EAFM within ICCAT. The Specific Contract N0 2 under the Framework Contract EASME/EMFF/2016/008 provisions of Scientific Advice for Fisheries Beyond EU Waters addresses the current impediments and provides solutions that shall support the implementation of an Ecosystem Approach to Fisheries Management (EAFM) through collaboration and consultation with the key tuna RFMOs. This Specific Contract has three main objectives: (1) Provide a list of ecosystem indicators (and guidance for associated reference points) to monitor impacts of fisheries targeting Highly Migratory Species (HMS); (2) Provide criteria and guidelines to choose ecological regions with meaningful ecological boundaries for HMS and its fisheries in order to facilitate the operationalization an EAFM in marine pelagic ecosystems; and (3) Provide guidelines for an EAFM plan using two ecoregions as case studies within ICCAT and IOTC Convention areas. The results of this contract will be imbedded in the EAFM process that ICCAT is carrying out through a close collaboration and communication with ICCAT SCRS. Ultimately, the products created throughout this contract will aim to facilitate the linkage between ecosystem science and fisheries management to foster the operationalization of an EAFM.

SCRS/P/2017/031 - The reduction of bycatch mortality is an objective of the ecosystem approach to fisheries and is also important for consumers of fisheries products. Along the French Mediterranean coast, two longline fishers associations allowed scientists to monitor the impact of their activities on various taxa. Partnerships with commercial fishermen were developed to enable them to participate in this study and to integrate their information, experience, and expertise. In order to decrease bycatch mortality rates of bycaught animals, a manual on best practices was developed. The manual provides appropriate handling practices to ensure crew safety and increase the odds of survival for elasmobranchs, sea turtles, and sea birds released to sea. The manual provides a description and basic information on the biology of the most common species encountered. It also includes fishing regulations. A leaflet derived from it was also edited and both documents have been disseminated to various fishing communities. Additionally, in order to reduce the incidence of unwanted catch, a bycatch iphone application called "EchoSea", was developed for fishers to report their bycatch data in real-time while at sea. The app uses a device's built-in GPS to fill in location coordinates on the data form. The bycatch reports are sent to a central server that is accessible to scientists in order to create taxa-specific abundance or "risk" maps by for fishers to avoid bycatch "hotspots". Finally, this work also includes the creation of a dedicated website geared for the fishing community with updates on on the project and includes live tracks of blue sharks (Prionace glauca), loggerhead sea turtles (Caretta caretta), pelagic stingray (Pteroplatytrygon violacea) and swordfish (Xiphias gladius) tagged with archival satellite tags (www.amop-selpal.com). Current goals are to prepare "a tool kit" comprised of a dehooker, line cutter, adapted to the fisheries for easy and safe releasing of unwanted catches.

*SCRS/P/2017/032* - An update to the EFFDIS effort database was requested by the Sub-Committee on Ecosystems in early 2017. The request was made because general updates had become available, and particularly because Japanese historical data had been revised. The ICCAT Secretariat updated the database in May 2017 using the latest data and the overall output will be presented. Details of the calculation, which combines information from Task 1 and 2 data will also be described.

*SCRS/P/2017/033* - reported on collaborative work to assess seabird bycatch in the pelagic longline fleets operating in the South Atlantic and Indian Oceans. Objectives of this work are i) to determine the spatio-temporal patterns of seabird bycatch, ii) to estimate the seabird bycatch (at the lowest possible taxonomic level), and iii) gain knowledge on the performance of mitigation measures. To progress, scientists from Japan, Brazil and Uruguay participated in a workshop in Montevideo, Uruguay (20th-23rd June, 2017) and Portugal contributed fine scale data. The meeting reviewed the data from each country to discuss the spatial/temporal resolution for analysis, the required data, as well as the possible alternatives for the data analysis. Other scientists have also been invited to collaborate in this work and share information. This analysis is expected to begin within approximately three months.

*SCRS/P/2017/034* - presented an analysis of the current status, required time for rebuilding, future catch, and future profitability for 397 European fish stocks (Mediterranean, Black Sea, and North-East Atlantic stocks). All stocks were assessed using the CMSY software in R with the implemented Catch-Only Monte-Carlo method CMSY and a full Bayesian State-Space Surplus Production Model. Four metrics were presented for future projections: (1) percentage of stocks that can produce MSY (B > BMSY), (2) percentage of stock below safe biological levels (B < 0.5 BMSY), (3) total catch (% change) and (4) a measure of change in profitability. Sustainable exploitation by 2015 has been achieved for only 1/3 of the stocks with overfishing still widespread, particularly in the Mediterranean Sea. The future projections show that the current target of F = 0.95 Fmsy would fail to rebuild depleted stocks and result in poor overall profitability. Fastest rebuilding is achieved with F = 0.5 FMSY. Highest profitability could be achieved with F = 0.6 - 0.8 FMSY, associated low risk of stocks falling outside safe biological limits.

*SCRS/P/2017/035* - This work on the assessment of the abundance of birds in Mauritanian waters is part of the study of marine and coastal biodiversity of Mauritanian waters. It focuses on the results of a campaign on the assessment of the abundance of sea birds/megafauna in the Mauritanian oceanic waters. The campaign that took place from 1 to 12th November, 2016 covered parts of continental shelf and slope from 15 to 1800 m deep from the north to the south. During this campaign, 26000 birds were observed for 41 bird species. The majority of these birds are migratory species from the Mediterranean, North Sea or Arctic to south. Eight species accounted for 96% of the total number of individuals observed. These are: Northern Gannet (Morus bassanus), Cory's Shearwater (Calonectris borealis), Pomarine Skua (Stercorarius pomarinus), Leach's Storm Petrel (Oceanodroma leucorhoa), Black Tern (Chidonias niger), Common Thern (Sterna hirundo), Sandwich Tern (Thalasseus sandvicensis) et Grey Phalarope (Phalaropus fulicarius). The northern Mauritanian area, located in front of the permanent upwelling of the cap Blanc, known for its richness, groups together a large part of these birds. The importance of fishing activity in this area suggests the need to take measures to protect these species.

*SCRS/P/2017/036* - The Namibian Large pelagics sampling programme involves industry skippers who record daily catches on logsheets and fisheries observers who record fish lengths on specifically designed sampling forms. This study was aimed at providing insights on the sampling programme and to evaluate the extent to which the catches of the Namibian pole and line fisheries were affected by seismic exploration activities in or close to fishing grounds. Data exploration was carried out and it was found that there were three versions of the logsheet being used. The coordinates of catch positions were unrealistic as catches made west of the 00 longitude could not be distinguished from those made east of that longitude. Only bycatch for which provision has been made on the logsheet were recorded, while all other bycatch were lumped as 'other'. Similarly, observers only recorded the species that were provided for on the logsheet. A new logsheet is being designed that will provide for the recording of seabirds and turtle bycatch. Seismic data was not obtained as the process for obtaining the data from the custodians proved too challenging.

*CCSBT-ERS/1703/27* - The document examined the statistical characteristics of the occurrence of seabird bycatch in the longline fisheries using the data collected through the Japan's onboard observer program in the period of 1997 to 2015. Only the data on the operations conducted in the south of 35S was utilized. The distribution of occurrence of seabird bycatch, both by operations as well as at the level of cruises, indicated a strong skewedness toward lower values with a long tail in the upper end. Around 10 percent of efforts with high seabird bycatch accounted for about half of the total bycatch. The variability in average bycatch rate among the cruises was considered to reflect a range of effectiveness of the mitigation measures that the fishers had applied. The shape of distribution indicated that a substantial portion of fishers succeeded to suppress an extent of seabird bycatch under a certain level. The analysis revealed a positive relation between the BPUE and the amount of hooks observed. It considered the average seabird captured per operation, showing more consistency that the BPUE against the number of hooks observed, to be more preferable as a standard indicator of referring the bycatch rate.

# Appendix 5

Updated ST09 observer data form fields. Note this is based on an excel sheet, and in many cases pull down menus are provided to limit the responses possible. These options are not provided here, but will be made available in the final version of the forms.

#### Appendix 12

# Work Plans of the Species Groups for 2018

# Tropical Tuna Work Plan

Paragraph 44 of Recommendation [16-01] requested SCRS to conduct a new stock assessment for bigeye tuna in 2018. This is consistent with the strategic research plan of the SCRS and is considered a priority because 1) the last assessment was conducted in 2015, 2) the overexploited status of the stock requires a close monitoring of the population, 3) the TAC agreed for 2016 has been overshot, 4) since the last assessment there have been significant changes to fishery historical data, and 5) new information from the AOTTP Programme would be available to inform the stock assessment. The stock assessment methods used in 2015 for providing the management advice (SS3 and ASPIC) should be used, in addition to other methods available in ICCAT stock assessment software catalogue, in 2018 bigeye stock assessment; which will require substantial data preparatory work by the Secretariat and other members of the Group. Moreover, Recommendation [16-01] and the ICCAT Working Group on FADs also requested the Tropical Working Group to address several questions in 2018, such as the analysis of the current FAD moratoria detailed in Rec. [16-01], standardization of FAD fishery definition and indicators, etc. Thus, due to the large workload foreseen for 2018, the Group considered that a *data preparatory meeting* is necessary during the second quarter of 2018 to prepare the *bigeye assessment Working Group meeting* during the third quarter of 2018.

#### Bigeye Data Preparatory meeting (quarter 2)

The Group requests that all data inputs be prepared through 2017. If the data meeting occurs before July 2018, the Group recognizes that some data inputs may be available only up to 2016 (which should be updated to 2017 before the stock assessment.

The Group considered the following work plan elements for the bigeye data preparatory meeting:

- Update bigeye catches (T1 and T2CE: catch and effort, T2SZ: size frequency) for all CPCs and fleets up until the year 2017. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting.
- Improving ICCAT Task I and II data, including complete the re-estimation of the historic Ghanaian statistics for bigeye (yellowfin and skipjack) up to 2017. Bearing in mind that there is funding available to improve the Ghanaian statistics, the Group reiterates the need for scientists from EU and Ghana to collaborate to adapt the T3 software and engage in capacity building to facilitate its use. This exercise will include:
  - A workshop/training on the T3 treatments procedure to correct logbook data (hypotheses, tools, etc.);
  - Comparison of catch estimation by T3+ process and the resulting estimation using alternative methods;
  - Organize capacity building for African nations and others CPCs involved in this issue.

Responsibility: IRD, MFRD (Ghana) and National scientists in conjunction with the Secretariat; deliverable: SCRS document and estimation of tropical tuna fishery statistics for bigeye, skipjack and yellowfin up to 2017; deadline: one week before the bigeye data preparatory meeting.

- The combined historical "FIS" fishery (FRA+CIV+SEN, before 1991) be split in Task II (T2CE and T2SZ/CAS) and allocated to the respective CPC in the line of what was made in Task I catches in the past. The same break down is required (T2CE and CAS) for the combined tropical ETRO fisheries (NEI-ETRO combined fleet) affecting mainly purse seine before 2006. Responsibility: Secretariat in collaboration with involved CPCs; deadline: one week before the bigeye data preparatory meeting.

- Estimations of *faux poisson* to be provided up to 2017. Responsibility: IRD/CRO; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document and estimation of tropical tuna fishery statistics for bigeye, skipjack and yellowfin up to 2017.
- Preparation of a preliminary bigeye CAS/CAA for discussion during the data preparatory meeting. Responsibility: Secretariat; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document.
- Update of standardized bigeye CPUE indices until 2017 for the Brazil, Chinese Taipei, Japan, Morocco, United States and Uruguay, and longline fleets. Note that indices for fleets that have wide spatial coverage have to also be provided by area (North, Equatorial and South) as agreed in the last assessment and ideally by year/quarter. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document and bigeye CPUE indices up to 2017.
- Update of standardized bigeye CPUE indices until 2017 for the European baitboat fishery (Azores and the fleet operating in Dakar) and purse seine fleets separated by fishing mode (FAD and free) by year/quarter. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document and bigeye CPUE indices up to 2017.
- Update biological information:
  - Indian and Pacific Oceans tagging data showed that bigeye longevity is over 10 years, which may imply lower natural mortality rates than previously being assumed for the Atlantic Ocean. Therefore, last assessment adopted a lower natural mortality vector which is considered to more appropriately reflect the longer longevity. AOTTP data and other sources could be reviewed to infer the most appropriate mortality vector to be used in the assessment. Different mortality vectors should be used as sensitivity cases in the assessment. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document;
  - Uncertainties in bigeye growth could be also affect the stock assessment. AOTTP data would be very valuable to infer most appropriate growth curve for bigeye for the Atlantic Ocean. Different growth curves should be used as sensitivity cases in the assessment. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document;
  - A knife-edge maturity was used in 2015 assessment. Recent sampling efforts in the Atlantic has produced a yellowfin maturity ogive based on histological analysis (Dihada *et al.,* 2016) which was used in the most recent yellowfin assessment. Develop a bigeye tuna maturity ogive based on histological analysis to be used in 2018 stock assessment. Responsibility: CPCs; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document;
  - Update tagging information about movements using most recent results of the AOTTP. Responsibility: CPCs and Secretariat; deadline: one week before the bigeye data preparatory meeting; deliverable: SCRS document.

#### Bigeye stock assessment meeting (quarter 3)

- Update T1 and T2 data and produce the final Catch at Size/Age matrix to be used in the stock assessment. Responsibility: Secretariat; deadline: one month before the bigeye stock assessment meeting.
- Review diagnostics of stock assessment models and select final stock assessment models to be used for management advice.
- Review and agree the input parameters for projections of the stock assessment models to provide the management advice.

- Prepare the detailed report of the stock assessment meeting
- Discuss and develop draft executive summary of bigeye

#### MSE

- Communicate with the Commission to determine appropriate performance metrics for the Tropical Tuna MSE. Discuss performance metrics for single and multiple species models. Responsibility: SCRS Chair; deadline: one month before bigeye assessment meeting.
- Continue to develop and review operating models. Responsibility: National scientists; deliverable: SCRS Document(s); deadline: one month before bigeye assessment meeting.

#### Start the review of AOTTP data and programme

- Review data collected and give feedback. Responsibility: National scientists; deadline: one month before data preparatory meeting.
- Evaluate new scientific information to be used for estimation mortality, growth rate, spatial structure, movement, etc. Responsibility: National scientists; deliverable: SCRS Document(s); deadline: one month before bigeye data preparatory meeting.

# Analyze the efficacy of the new area/time closure in relation to the protection of juvenile tropical tunas pursuant Rec. 16-01 (e.g. by reviewing the data collected through the AOTTP)

Using data through 2016:

- Examine the catch, effort and size frequency (Task II) of yellowfin and bigeye tuna landed by surface fleets in the tropical Atlantic by 1x1 grid and month.
- Evaluate time/area closures that could achieve certain percentage (10% to 50%) reductions in the annual catches juvenile yellowfin and bigeye tuna.
- Provide information on how these reductions will affect the projected stock status (i.e. SSB/SSB<sub>MSY</sub> and F/F<sub>MSY</sub>) and recovery schedule, and other measures as possible (e.g. YPR, SPR).

Responsibility: National scientists; deliverable: SCRS Document(s); deadline: one month before bigeye data preparatory meeting.

#### Expected impacts on MSY and stock status of different gear catch contribution

- Develop a table for consideration by the Commission that quantifies the expected impact on MSY, B<sub>MSY</sub>, and relative stock status for both bigeye and yellowfin resulting from reductions of the individual proportional contributions of longline, FAD purse seine, free school purse seine, and baitboat fisheries to the total catch. Rec. [16-01] paragraph 49 (c). *Responsibility:* National Scientists; *deliverable:* text and supporting tables/figures for Commission Response; *deadline:* one week prior to SCRS Species Group meeting.

# *Review Ghana's comprehensive and detailed capacity management plan (Rec. [16-01] paragraph 12c)*

- Combine the datasets into a single format that can be used to support the necessary analyses. Responsibility: Secretariat; deliverable: Dataset; deadline: one month before bigeye data assessment meeting.

#### **Albacore Work Plan**

During 2017, the Mediterranean albacore stock was assessed and several research lines were identified in order to improve future stock monitoring. Likewise, substantial progress was made on the development of the North Atlantic albacore MSE framework, which has been specifically tailored to evaluate a series of model-based HCRs within a Management Procedure that mimics the 2016 stock assessment of North Atlantic albacore. As such, the Committee considers that the MSE for North Atlantic albacore should continue its development in the coming years and many future avenues to improve the framework were identified. In 2018, the Albacore Tuna Species Group plans to further develop the MSE framework for North Atlantic albacore, improve biological knowledge for Mediterranean albacore and improve CPUE series for all three stocks. No intersessional meetings are envisaged, but a three day meeting during the Species Groups is suggested.

# North Atlantic Stock Proposed Work Plan

Given the uncertainty on the results obtained in the last 2016 assessment, the Group reiterates the need to carry out a comprehensive Research Programme (see **Appendix** to albacore work plan). The main research objectives identified by the Albacore Species Group are:

- 1. Improved knowledge of the biology and ecology
- 2. Improved monitoring of stock status
- 3. Development of Management Strategy Evaluation framework

The Committee endorses the proposed research plan and recommends funding be initiated in 2018 or as soon as possible.

During 2018, a small open group will work electronically to continue the development of the MSE framework, following the advice of the SCRS and the Commission. The work will include conducting additional diagnostic checks (e.g. the characterization of the unrealistic runs and alternatives to decrease their frequency) and exploring additional management procedures (e.g. alternative stock assessment models, model free management procedures). As for the operating models, it is important to characterize those OMs that might not be meeting the objectives under certain HCRs. Additional OMs that consider alternative realities (e.g. regime shifts, autocorrelated recruitment, changes in selectivity) can also be added to the current set of OMs.

Deadline: one week before the Species Group meeting. Deliverable: SCRS documents, following the standards provided by the WGSAM. Responsibility: CPCs.

In addition, it is recommended to produce new, or improve existing CPUE indices, namely:

- French MWT: standardize CPUE and produce new index;
- Japanese longline: consider alternative ways to incorporate targeting effects (e.g. based on species composition) to try to recover the early periods;
- Korean, EU-Portugal and EU-Spain longline: consider using albacore by-catch information during swordfish oriented operations to produce an abundance index.

Deadline: one week before the Species Group meeting. Deliverable: SCRS documents, following the standards provided by the WGSAM. Responsibility: CPCs.

It is also requested that the recent submissions of Task II data by EU-France be documented, so that the Working Group can decide to accept the new data, or not. Deadline: Species Groups meeting. Deliverable: SCRS document. Responsibility: EU-France.

# South Atlantic Stock Proposed Work Plan

It is recommended to produce new, or improve existing CPUE indices, namely:

- Compare and consider feasibility of joint CPUE analyses for longline fleets (Brazil, Chinese Taipei, Japan, Uruguay,) using fine scale, operational level data.

Deadline: one week before the interssessional meeting. Deliverable: SCRS documents, following the standards provided by the WGSAM. Responsibility: CPCs.

#### Mediterranean Albacore Stock Proposed Work Plan

Given the uncertainty on the results obtained in the last 2017 assessment, the main research objectives identified by the Albacore Species Group are:

- 1. Improved knowledge of the biology (reproduction, growth and age) and ecology;
- 2. Improved monitoring of stock status, including update of the CPUE series used in the assessment (EU-Spain longline, EU-Italy longline, Balearic larval survey) to confirm recent stock trends;
- 3. Explore alternative stock assessment methods suitable for data poor stocks.

Deadline: one week before the interssessional meeting. Deliverable: SCRS documents, following the standards provided by the Working Group on Stock Assessment Methods (WGSAM). Responsibility: EU-Spain, EU-Italy.

# Appendix to albacore work plan

# North Atlantic Albacore tuna Research Programme

The Albacore Species Group proposes to initiate a coordinated, comprehensive four yearlong research programme on North Atlantic albacore to advance knowledge of this stock and be able to provide more accurate scientific advice to the Commission. This plan is based on the plan presented in 2010, which was based on document SCRS/2010/155, that has been revised according to new knowledge, reconsidering the new most important priorities and reducing the total cost.

The research plan will be focused on three main research areas: biology and ecology, monitoring stock status and management strategy evaluation, during a four-year period.

# **Biology and Ecology**

The estimation of comprehensive biological parameters is considered a priority as part of the process of evaluating northern albacore stock capacity for rebounding from limit reference points. Additional biological knowledge would help to establish priors for the intrinsic rate of increase of the population as well as the steepness of the stock recruitment relationship, which would facilitate the assessment. Among the key biological parameters are ones related to the reproductive capacity of the northern albacore stock, which include sex-specific maturity schedules (L50) and egg production (size/age related fecundity). In order to estimate comprehensive biological parameters related to the reproductive capacity of the northern albacore stock, an enhanced collection of sex-specific gonad samples need to be implemented throughout the fishing area where known and potential spawning areas have been generally identified. The collection of samples need to be pursued by National scientists from those fleets known to fish in the identified areas and willing to collaborate in the collection of samples for the analysis. Potential CPCs that could collaborate with the sampling programme may include (but not limited to): Chinese-Taipei, Japan, USA and Venezuela. Expected results will include a comprehensive definition of sex-specific maturity development for albacore, spatial and temporal spawning grounds for northern albacore, estimate of L50 and size/age related fecundity.

The albacore Working Group also recommended further studies on the effect of environmental variables on CPUE trends of surface fisheries. The understanding of the relationship between albacore horizontal and vertical distribution with the environment will help disentangle abundance signals from anomalies in the availability of albacore to surface fleets in the North East Atlantic.

It is also proposed to conduct an electronic tagging experiment to know more about the spatial and vertical distribution of albacore throughout the year. Given the typically high cost of this kind of experiment, and the difficulties to tag albacore with electronic tags, it is proposed to deploy 50 small size pop up tags in different parts of the Atlantic where albacore is available to surface fisheries (to guarantee good condition and improve survival), namely the Sargasso sea and off Guyanas, off USA/Canada, Azores-Madeira-Canarias, and the Northeast Atlantic.

Last, the existence of potential subpopulations in the North Atlantic has been largely discussed in the literature. While recent genetic studies suggest genetic homogeneity (Laconcha *et al.* 2015), otolith chemistry analyses (Fraile *et al.* 2016) suggested the potential existence of different contingents, which could also have important management implications. Thus, in order to clarify the existence of potential contingents, we propose to expand the limited study area in Fraile *et al.* (2016) to the entire North Atlantic, as well as to address inter-annual variability through multiyear sampling and analysis of otolith chemistry.

# Monitoring of stock status

The Group recommends the joint analysis of operational catch and effort data from multiple fleets be undertaken, following the example of other species working groups. This would provide a more consistent view of population trends, compared to partial views offered by different fleets operating in different areas. The analysis is suggested for both longline fleets operating in the central and western Atlantic, and surface fleets operating in the northeast Atlantic.

Finally, given the limitations of the available fishery dependent indicators, the Group mentioned the need to investigate fishery independent abundance indices. Although the Group is aware that, in the case of albacore, there are not many options to develop such fishery independent indices of abundance, it is proposed to conduct a feasibility test using acoustics during baitboat fishery operations to improve the currently available indices. A fine scale analysis for surface fisheries catch of albacore recruits (Age 1) is suggested to analyse the feasibility of designing some transect based approach for a recruitment index.

# Management Strategy Evaluation

The Albacore Species Group recommends that further elaboration of the MSE framework be developed for albacore, considering the recommendations by the Methods and the Albacore tuna Working Groups, as well as the guidance of the Commission and the t-RFMO initiative. Among other things, work should be promoted towards exploring additional operation models (e.g. considering autocorrelated recruitment or regime shifts), improving observation error models (e.g. considering changes in catchability over time), considering alternative management procedures (e.g. harvest control rules that consider bounds to the management action, alternative stock assessment models, and CPUEs with different characteristics, such as very noisy CPUEs or CPUEs that track only some age classes), and considering implementation error (or systematic bias). There is also a need to discuss and propose alternative performance indicators and find better ways to communicate results.

The total requested funds to develop this research plan have been estimated in 1.192.000 Euros, with 542,000 Euros to cover priority 1 tasks. The research programme will be an opportunity to join efforts from an international multidisciplinary group of scientists currently involved in specific topics and fisheries.

# Budget

Research aim	Priority	Approximate 4 year cost (€)
Biology and Ecology		
Reproductive biology	1	200,000
(spawning area, season, maturity, fecundity)		
Environmental influence on	1	50,000
NE Atlantic surface CPUE		
Distribution throughout the Atlantic (e-tags)	2	350,000
Population structure: contingents	3	120,000
Monitoring stock status		
Joint Atlantic longline CPUE	1	30,000
Joint NE Atlantic surface CPUE	1	12,000
Feasibility of fisheries independent survey	3	180,000
Management Strategy Evaluation		
Development of MSE framework	1	250,000
	Total	1,192,000

# **Bluefin Tuna Work Plan**

In 2017 the SCRS held two intersessional meetings (data preparatory and stock assessment meeting) to incorporate new information in the ICCAT databases and new modeling frameworks into the assessments of both the eastern and the western bluefin tuna stocks. Given the uncertainties identified in these assessments, the SCRS focused on providing short-term advice through 2020. Accordingly, the SCRS recommends that the next assessment be conducted in 2020.

In the interim, the SCRS proposes to focus its efforts on addressing several areas where the data and assessments might be improved. No intersessional meetings will be scheduled for 2018. The work plan for 2018 is as follows:

- 1. Update the scientific advice at the species group meeting preceding the 2018 SCRS plenary based on: a) revised forecasts that take into account the actual catches in 2016 and 2017; and, b) updated fishery indicators (as prescribed by Rec. [12-03], paragraph 50). Action National Scientists and Secretariat.
- 2. Hold a meeting of the Core Modelling Group (TBD in 2018) to specify remaining characteristics of the operating model; define the scope of possible management procedures; and agree on a detailed time schedule for the next few years for use by ICCAT GYBP, the SCRS, and the Commission.
- 3. Engage in research to address key uncertainties in the assessment, such as:
  - (a) Hold a workshop (perhaps sponsored by ICCAT GBYP) to investigate the spawning behaviour of bluefin tuna and in particular at each age class that actively contribute to spawning each year.
  - (b) Identify environmental factors that affect catchability at basin and local scales and explore methods for incorporating these factors in the index standardization. The potential for combining the data and creating a joint handline index should also be explored.
  - (c) Collect paired hard parts (spines and otoliths) in both the East and West to help estimate the bias across all ages. Complete aging of the backlog of eastern and Mediterranean otoliths, focusing primarily on the gaps in size and spatio-temporal fishery (ies) representativeness. The effect of bin-size on age-length keys construction should be investigated.
  - (d)Improve partitioning of the time series of Mediterranean purse seine catches between small (<160 SFL) and large (>160 cm SFL).
  - (e) Review and submit Task II size frequency data by fleet. Fill in the gaps in the size composition data (historical and future) to be representative of the temporal and spatial fishing patterns.
  - (f) Further investigate comparability over time of the Mediterranean EU-France aerial survey and the larval survey.
  - (g) Review protocols and guidance developed by the bluefin tuna working group on model selection and projections (possibly through the SCRS Methods Working Group) with a view towards adopting a standard approach for analysts providing stock assessment models to future SCRS assessments.
- 4. All members of the Species Group are encouraged to attend the planned meeting in 2018 on the MSE work and the Core Modelling Group. It was noted that those involved in developing candidate MPs do not need to be experts in MSE.

# **Billfish Work Plan**

Assessments for the marlin stocks were conducted in 2011 (blue marlin), and 2012 (white marlin). The next stock assessments for the marlin species are schedule for 2018 (blue marlin) and 2019 (white marlin).

For the upcoming blue marlin stock assessment in 2018 two intersessional meetings will be held, the first meeting will be a Data Preparatory (DP) meeting to compile and analyze all existing information required for the stock assessment, and the second meeting will be the stock assessment (SA) meeting.

Several high priority tasks have been identified that require increased effort, including, but not limited to:

# Catch and Effort Data (Task I and II)

Important blue marlin catches occur in the tropical and subtropical central Atlantic by both CPC and non-CPC fisheries, mainly in the Caribbean Sea and off West Africa. In past assessments, the quality and completeness of Task I and II data has been of great concern. Therefore, all countries catching billfishes (directed or by-catch) should report species-specific catch, catch-at-size, and effort statistics by as small area as possible, and by month. Historical catch data should be revised at the species level and provided to ICCAT within the established deadlines.

It is a very high priority to have comprehensive analyses of species-specific billfish catch and effort statistics from small scale (or artisanal) fisheries of CPCs and non-CPCs operating in the Convention area, specifically from the Caribbean region. Noting that fund allocation is highly likely, the terms of reference for this endeavor are included as an **Appendix** of the present billfish work plan.

# Discards

Information on the number of blue marlin landed, and the numbers discarded (dead and released alive) should be reported in order to fully quantify catches in all months and areas. Reporting of these data should meet the ICCAT deadlines for submission of Task I and II data. National scientists and the ICCAT Secretariat can collaborate to investigate whether the available observer data provide insights into the low reporting of dead/live discards. A need for determining levels of post release mortality warrants additional research, so that the full effects of blue marlin discards can be included in the next stock assessment. This research must be presented at the data preparatory meeting.

# Standardized CPUE series (Spatially explicit)

Noting the severe difficulties in interpreting and fitting indices within stock assessment models, it is recommended that national scientists of all CPCs coordinate their work to consider how to reconcile divergent CPUE patterns that may be a function of changes in fleet spatial distribution, oceanography, and/or targeting. Therefore, for the next blue marlin assessment efforts should be made to include combined indices of fleets with similar operational characteristics, or that estimated indices be area specific indices of abundance and include additional gear types (not just LL). These standardized CPUE series must be provided at the data preparatory meeting for evaluation.

#### Life history parameters

Recent marlin and sailfish assessments have relied on growth parameters estimates from other Oceans which may have an unwanted effect on the results of the Atlantic species assessments. Efforts should be made to coordinate interested national scientists in conducting growth and maximum age estimate studies for Atlantic blue marlin. A review of all life history information for Atlantic blue marlin will be compiled prior to the data preparatory meeting.

#### Tag-recapture information

A comprehensive analysis of the available tagging data for billfish in the ICCAT and other relevant databases are warranted. In recent billfish stock assessment tag-recapture data have been revised, but a comprehensive analysis is missing. Noting the potential use of tagging data applied to Stock Synthesis models, the ICCAT data will be further evaluated to determine its appropriate value for inclusion in the next blue marlin stock assessment. The Secretariat will provide the data and national scientists will conduct the analysis during the data preparatory meeting.

#### Appendix to the billfish work plan

# **Terms of Reference**

# Comprehensive study of strategic investments related to artisanal fisheries data collection in ICCAT fisheries of the Caribbean/Central American region

# **Proposed Project:**

Conduct an inventory of existing data collection programmes in ICCAT fisheries of the Caribbean/Central America States and develop specific recommendations to improve data reporting in artisanal fisheries in the region.

#### Rationale and Objectives:

ICCAT's Standing Committee on Research and Statistics (SCRS) has identified the need to strengthen data collection and reporting for artisanal fisheries targeting ICCAT species (with particular focus on those targeting billfish and shark species) in the Caribbean and Central American region. Since 2003, ICCAT funds have been invested to help improve the collection of tuna fishery statistics by Parties which do not have sufficient capacity to meet some of their obligations. Success has been seen with projects in Côte d'Ivoire, Morocco, Senegal, and Venezuela. Other Contracting Parties have also benefited from these funds to recover historical data or conduct surveys in the context of artisanal fisheries.

In 2014, ICCAT funded a Strategic Investment Inventory for artisanal fisheries of West Africa. Using that study as a model, this project aims to get a clear understanding of existing data collection programmes and investments related to artisanal fisheries of the Caribbean/Central American region targeting ICCAT species (giving priority to those targeting billfish and shark species), in order to avoid duplication of effort and maximize the effectiveness of ICCAT's capacity building funds. The inventory will be used to support collaboration with relevant programmes in the regions. Ultimately, this study aims to harmonize data collection programmes and increase the level of data reporting to ICCAT.

A contractor with extensive regional experience in artisanal fisheries data collection (on conventional [TUN & SWO] and non-conventional ICCAT species [BIL, SHK, SMT]) and ICCAT data reporting protocols, as well as broad knowledge of government and academic institutions in the region, is essential to the success of this project.

#### Scope:

The inventory will include Contracting and non-Contracting Parties in the Caribbean/Central America, with a focus on those with substantial catches of ICCAT species in artisanal fisheries (giving priority to those targeting billfish and shark species) and known data deficiencies. The primary countries where a data collecting programme will be explored are Barbados, Curaçao, Guyana, Surinam, Trinidad and Tobago, and Venezuela. Secondary countries may include Central America CPCs, Colombia, Dominican Republic, and Grenada.

# Deliverables:

- 1. Interim report of progress and presentation to the blue marlin data preparatory meeting in 2018.
- 2. Mid-term report to be submitted by 30 May 2018, including a description of the methodology and work conducted to date.
- 3. A final report to be submitted to the SCRS for review by 8 September 2018, including: an executive summary, description of the work conducted, detailed inventory of relevant programmes and contacts in the region, description of the fisheries, recommendations for next steps, and references and literature cited.
- 4. An updated final report based on SCRS input by 1 November 2018.

# Budget:

The estimated cost of this study is on the order of US\$50,000.

# Atlantic and Mediterranean Swordfish Work Plans

# North and South Atlantic

Assessments for North and South Atlantic swordfish were conducted in 2017. The next assessment is not yet scheduled. A list of recommended work for the swordfish Working Group was identified as high priority areas where continued efforts are required for North and South Atlantic swordfish:

#### *Size/Sex distribution study*:

- *Background/objectives:* The Group recommends that at detailed size and sex distribution study is started in order to better understand the spatial and seasonal dynamics of swordfish in the Atlantic. This study should be carried out in a cooperative manner between scientists, involving as many fleets as possible and preferably using detailed fishery observer data. This is particularly important if future alternative management measures are considered, for example when considering spatial/seasonal protection areas for juveniles. Additionally, such study would also provide a contribution for the stock delimitation work.
- *Priority:* High priority
- *Leader/Participation:* EU-Portugal, with collaboration of CPCs willing to participate/share data on size/sex/location from observer programmes.
- *Timeframe:* Start in 2018, to be completed in 2019.

# PSAT tag data request for joint analysis:

- *Background/objectives:* The Group encourages all CPCs to provide their swordfish PSAT tag data to an *ad hoc* study Group. At a minimum the data should include the temperature and depth by hour, date and one degree latitude\*longitude square. This will contribute to support the improvement of CPUE standardization through the removal of environmental effects as well as for the better definition of stock boundaries.
- Priority: High priority
- *Leader/Participation:* Lead by US, with the participation of CPCs with PSAT tag data
- *Timeframe:* Start in 2018, to be completed in 2019

#### Life history:

- *Background/objectives:* An understanding of the species biology, including age, growth and reproductive parameters is crucial for the application of biologically realistic stock assessment models and, ultimately, for effective conservation and management. Given the current uncertainties that still exist in those biological parameters, the Group recommends more studies on swordfish life history are carried out. Those should be integrated with an ICCAT swordfish research plan that is provided in the recommendations with financial implications.
- *Priority:* Medium/High priority

- *Leader/Participation:* To be identified
- *Timeframe:* To be decided

# Weight-length relationships:

- *Background/objectives:* The Group recognizes that the adopted length-weight relationships for swordfish require validation with new field information. National scientists are requested to collect and submit observed values of length (LJFL) and round weight data to the Secretariat to facilitate this task, aiming finishing by 2018 the ongoing analysis.
- Priority: High priority
- *Leader/Participation:* Canada will lead, with the participation of CPCs willing to submit length/weight observed data.
- *Timeframe:* To be completed in 2018.

# Larval index work:

- *Background/objectives:* An initial swordfish larval index was presented in the swordfish data preparatory meeting. The Group recognized the value of adding fishery-independent indexes to the stock assessment, but there were still concerns about the surveyed area. Therefore the Group recommended to include this work into the swordfish work plan to determine if those issues can be solved and this or other fishery independent indexes can be improved and used in the future.
- Priority: High priority
- Leader/Participation: Lead by US, determine possible participation of Canada.
- *Timeframe:* Should be completed for the next stock assessment.

# Continuing work on environmental effects:

- *Background/objectives:* Given the possibility of spatial and environmental effects being partially responsible for the conflicting directions of some of the influential indices of abundance, the Group should further study into this hypothesis during the coming years, use existing PSAT data to compliment this work, and to determine how best to formally include these environmental covariates into the overall assessment process. The U.S. has taken a lead role in this investigation and likely collaborators would include scientist from Canada, Japan, EU (Spain and Portugal) as their indices were the most appropriate for this work. Expected deliverables would include quantified reduction in the conflicting indices of abundance from the temperate and tropic regions, which in turn should lead to a more stable assessment. Other products could include an increased understanding of the distribution of swordfish and perhaps a revisiting of the geographic structure of the data and the assessment. Ideally, these works should be done before the next stock assessment.
- Priority: High priority
- Leader/Participation: Lead by U.S., with participation of other CPCs.
- *Timeframe:* Ongoing, to be considered at the next stock assessment.

# Model predictions cross validation:

- *Background/objectives:* Model predictions should be compared to observations (e.g., nominal catch, CPUEs) rather than quantities such as F and SSB that cannot be observed, otherwise there is the risk of subjectively choosing model solutions. It is recommended that the WGSAM uses the North Atlantic swordfish assessment to explore the use of cross-validation of predicted data for model validation. This can also be used for weighting or selecting operating model scenarios in an MSE.
- *Priority:* Medium priority.
- *Leader/Participation:* Stock assessment modellers.
- *Timeframe:* For the next stock assessment.

# Activities pertaining from the 2017 External Assessment Reviewer

# Future work on stock assessment:

- *Background/objectives:* The 2017 external reviewer supported the Group's conclusions on technical merits regarding which models to use in future. JABBA is good and flexible biomass dynamics formulation and SS provides an age-structured approach that is ready to use size data and oceanographic indicators. It was encouraged full documentation of JABBA and inclusion in the ICCAT catalogue of methods.

- *Priority:* High priority
- *Leader/Participation:* JABBA model developers (South Africa and U.S.), in collaboration with the WGSAM.
- *Timeframe:* JABBA full documentation process is ongoing and expected to be completed in 2018.

# Clear presentation on CPUEs

- *Background/objectives:* The reviewer encouraged more explicit, clear presentation and comparison of CPUE trends by fleet and area and season. Outliers need to be identified and potentially down-weighted in combined indices and assessments.
- Priority: High priority
- Leader/Participation: All CPCs that present CPUE series for the next assessment
- *Timeframe:* Next stock assessment

# MSE work

- *Background/objectives:* MSE needs to be able to incorporate AMO effect and spatial distribution and changing catchability in the operating model. From this, it seems feasible to test whether a simple combined CPUE could be an accurate indicator of stock trends. MSE could either take a detailed and technical approach (e.g. spatial and oceanographic effects on the CPUE indices and subsequent effect on the assessment), or it could take a management oriented approach to investigate possible changes in the HCR. While both goals could be done at the same time, it might be better to tackle these as different projects in order to have high client engagement in the HCR project.
- *Priority:* High priority
- *Leader/Participation:* To be decided.
- *Timeframe:* Process to start in 2018, taking into account the ICCAT Commission schedule regarding SWO MSE work.

# Sensitivity analysis for catches/discards

- *Background/objectives:* Conduct sensitivity analysis with estimated total catch, including plausible degree of discard/retained catch ratio changing over time.
- Priority: High priority
- Leader/Participation: Stock assessment modellers and scientists involved in the assessment
- *Timeframe:* Next stock assessment

# Mediterranean

For the Mediterranean stock, the last assessment was conducted in 2016. The next assessment should take place not before 2020 in order to give more time for additional data to be collected and see the effects of the recently adopted Rec. 16-05. Additionally, a data preparatory meeting should be conducted the year before, to analyze and prepare data for the stock assessment.

Given the questions raised during the latest assessment the Group should develop a work plan aiming:

- To achieve the collection and recovery of historical data to increase the period covered by time series, the nominal data presented in past studies (e.g. De Metrio *et al.* (1999)) should be recovered and evaluated for possible standardization.
  - Time-frame: next assessment
  - Priority: high, depends on funding
  - Participation: mainly EU-Italy in collaboration with other CPs
- To improve stock delimitation and quantify stock mixing between the Mediterranean and North Atlantic swordfish stocks through multi-disciplinary research, including biological, tagging (both electronic and conventional) and genetic investigations. An integrated review of the existing relevant information should be prepared to identify current gaps and facilitate the development of future research regarding those issues.
  - Time-frame: 2018 for the integrated review
  - Priority: high

- Participation: all CPs
- To better identify the effects of the environment on swordfish biology, ecology and fisheries. Future CPUE analyses should evaluate the benefits of incorporating environmental factors on the distribution of spawners and juveniles.
  - Time-frame: next assessment
  - Priority: medium
  - Participation: all CPs
- To improve knowledge on the biology of the species including the investigation of possible regional differences on size/age at maturity and growth parameters, as well as, estimations of spawner and recruit proportions in the catches.
  - Time-frame: next assessment
  - Priority: medium, depends on funding
  - Participation: all CPs
- To examine the potential of using alternative indicators and reference points (L<sub>opt</sub>, measures based on reproductive potential, etc.).
  - Time-frame: next assessment
  - Priority: medium
  - Participation: all CPs

# Small Tunas Work Plan for 2018-2019

The following actions should be taken into account for improving statistical and biological data as well as the structure of small tuna populations. A substantial improvement in the data within SMTYP would allow conducting assessment in the near future based on the data poor stocks assessment methods in order to provide ICCAT with appropriate management advice for fisheries targeting small tuna:

- National scientists should develop and analyze simple fisheries indicators on small tunas (e.g. CPUE, mean size, proportion of juveniles, estimating fishing mortality, etc.), which should be presented at the 2018 Small Tunas Species Group Intersessional Meeting;
- Select the most appropriate methods and data and knowledge requirements. This work should be electronically by the Group;
- Hold an intersessional meeting in 2018 with the aim to provide management advice for WAH, BON, and LTA, using the data limited assessment methods (for more information please see the 2017 Small Tunas Species Group Intersessional Meeting Report, SCI\_028);
- Update the life history metadata base of SMT, with new information collated during the recent years under the SMTYP;
- Collaborate, as much as possible through joint working groups, with other RFMOs to improve and exchange basic fisheries data and data poor stock assessment methods for small tunas.

# Sharks Work Plan

Hold an intersessional meeting with the following objectives:

- Review activities and progress of the SRDCP;
- National scientists to identify and start preparing all information relevant to the assessment of porbeagle in 2019, including catch, CPUE, length composition, and biology, and trade data if available;
- Review all porbeagle information available at the Secretariat and results of the ABNJ Southern Hemisphere porbeagle project;
- Review updated ICCAT tagging database incorporating sex-specific information to develop an integrated growth model based on both tag recapture data and growth band counts from vertebrae for shortfin mako;
- Continue update of age and growth and reproductive dynamics of shortfin mako.

# Working Group on Stock Assessment Methods Work Plan (WGSAM)

- 1. Continue its work on the LLSIM simulation study on developing best practices for CPUE standardization.
- 2. Continues to work on how best to bring spatially changing oceanographic, environmental conditions and climate change into the assessment process.
- 3. Continues discussion and review of MSE, Harvest Control Rules, Limit, Threshold and Target Reference points.
- 4. Encourages papers, discussion and debate on how to best maintain the uncertainty captured via the multiple model approach while still making the communication of this practice clear and effective.

# Work plan for the Sub-Committee on Ecosystems and By-catch

#### Pertaining to Ecosystems:

#### 2017 SG meeting

• Present Concept Note to rapporteurs of Species Groups regarding the development of an ecosystem report card, along with the justification and implementation plan. This initiative is to involve the SGs.

2018 Sub-committee on Ecosystems

- Develop a draft Report Card inter sessionally (realistic prototype) in conjunction with SG experts.
- Review Report Card at meeting
- Review/update EBFM implementation plan

2018 Dialogue with Science and Managers and Commission Meetings

• Introduce concept of Report Card and progress on an EBFM plan and involve managers in the development.

# Pertaining to by-catch:

- Continue with the collaborative process of assessing the impact of longline fisheries on bycatch of seabirds which has been developed by the Sub-committee in conjunction with CPC scientists, as well as the effectiveness of Rec. 11-09.
- Initiate a process of scientific collaboration among researchers of ICCAT CPCs to elaborate on the results obtained to date regarding knowledge of the impact of the fisheries on sea turtles.
- Advance with the definition and knowledge of fish by-catch species, which are not considered by any ICCAT species group, to understand the effects of their capture on the ecosystem and the set of ICCAT species.
- Strengthen the relationship with the SCRS species groups so as to integrate the analyses of the different groups regarding the by-catch component of the fisheries.

# Sub-Committee on Statistics Work Plan

# Finalize "short term" ongoing projects

- Web-form prototyping (for ST forms 1 6). 7-10 to be started
- JAVA application to validate ST forms (ST01 to ST06) for CPC scientist's use
- Replacement of MS-ACCESS (t2ce.mdb & t2sz.mdb) by SQLite 3.8+ databases

# Continue "long term" ongoing projects

- Continuous update of the ICCAT-DB documentation framework
- Maintain the work on the ICCAT cloud infrastructure (deployment/integration of services)
- Continue the work on the GIS system (terminate sampling areas geo-referencing :: shapfiles)
- Continue the development of an online reporting system as requested by the Commission

#### Start projects (short/long term)

- "Full" redesign of the "tagging" database (conventional/electronic) system :: (long term)
- Migration of MS-SQL server 2008R2 to a new version URGENT (outdated now)
- ISSF data unloads project (if no decision is made, these data can never be properly used)

#### And simultaneously: the ICCAT-DB content/the meetings preparation/the estimations

- Continue data recovery (data gaps, better resolution and normalization of Task II)
- Continue improve of Task I (eliminate carry overs, allocate NEI catches to proper flags, reduce UNCL gears, etc.)
- Provide the most up-to date information to SCRS

# Appendix 13

# Preliminary Budget for the Implementation of the MSE Work Plan

	2018				2019				2020				2021				Budget (Thousands of Euros)				
Species	ALB-N	BFT	SWO-N	TROP	ALB-N	BFT	SWO-N	TROP	ALB-N	BFT	SWO-N	TROP	ALB-N	BFT	SWO-N	TROP	2018	2019	2020	2021	Total
Development of OM framework			X	X													150	0	0	0	150
Conditioning of OM				Х								Х				Х	30	0	30	30	90
Development of OM alternatives			Х					Х									70	90	0	0	160

																	200	250	240	510	90

Costs do not include capacity building for MSE or meetings for dialogue between scientists and stakeholders/Commission. ICCAT GBYP is expected to cover the full cost of the BFT MSE.

Note that ALBN and BFT MSE processes have already had significant funding for the last few years.

# Appendix 14

# Summary Note on the FAO Common Oceans/ABNJ Tuna Project

At its meeting in November 2012 in Agadir, the Commission gave its consent for the Secretariat to take the necessary steps to become a partner of the ABNJ/GEF programme. For this purpose, the Secretariat wrote a letter addressed to the FAO and the GEF to inform that ICCAT would join the programme provided that ICCAT benefited from the activities envisaged.

Since implementation of this programme, the Secretariat has participated actively in various technical and administrative meetings. It has contributed efficiently to the work of the Steering Committee and to the discussion of the different work plans. At the 2015 ICCAT Commission meeting, it was decided to continue to cooperate with this programme provided that there are benefits to ICCAT. To this end, since the previous SCRS Plenary, the ICCAT Secretariat has participated in several ABNJ Common Oceans initiatives. These include participation in the following meetings that were funded or partially funded by the Project:

- Joint tuna RFMO MSE meeting held at the Secretariat office, Madrid (1-3 November 2016);
- Joint Meeting of tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management, which took place in FAO HQ in Rome, Italy (12-14 December 2016);
- 1st Regional Seabird By-catch Pre-assessment Workshop held at the Kruger Park, South Africa (23 February – 1 March 2017);
- Tuna compliance network meeting held in Vigo and Madrid, Spain (27-31 March 2017);
- 1st Joint T-RFMO FAD Working Group Meeting, held in Madrid, Spain (19-21 April 2017).

In addition, ICCAT has been coordinating a feasibility study on the development of an online reporting system. This includes both a feasibility study to determine the resources, costs, technologies required to implement an online reporting system, as well as the production of a demo online reporting tool. Due to the requirements of the ABNJ Project, this study and demo are generic and could potentially be applied across the tuna RFMOS.

The Steering Committee of the FAO Common Oceans/ABNJ tuna Project met at the FAO headquarters in Rome in July 2017 and reviewed the activities undertaken during the last year. Most activities were presented by the Coordinator of the programme, with some additional presentations by those leading individual activities. There was also a presentation on the mid-term evaluation of the project, followed by a brief discussion, and some consideration to a possible second phase of the Project under GEF-7.

The mid-term evaluation highlighted the lack of a role for ICCAT within the Project and recommended greater involvement. The visit to the Secretariat by the ABNJ tuna Project management team, with a similar intent, encouraged the Secretariat to put forward some proposals in areas which had been requested by the Commission members. However, not all the Commission requests were put forward, as some of these did not fall into the categories of activities required, and hence could not meet with approval, most notably possible financing of AOTTP, as the Project design had been developed from the outset and any proposals must fall within the already agreed component areas.

The main proposals put forward are listed below and contained in the **Appendix.** Unfortunately, once again, ICCATs attempts to increase collaboration with the Project were not particularly successful. Although the activities listed below were included in the final budget, the level of funding available is not clear in all cases:

- 1. Proposal for a 2nd Joint t-RFMO FAD Working Group Meeting;
- 2. Proposed meeting of the t-RFMO MSE Working Group (and associated activities);
- 3. To lead and coordinate an Ecosystem Component: Common Oceans ABNJ tuna Project,
- including a follow-up meeting to that held in December 2016;
- 4. Support for ICCAT Port Inspection Expert Group for Capacity Building and Assistance.

While some of the proposals put forward by ICCAT were accepted, and others had already been foreseen in the work plan, some of the additional activities were not initially approved, on the basis at the time that they were activities stemming from the Kobe process and required consultation with other tRFMOs to ensure that there was no duplication of effort. The proposals contained in the **Appendix** were circulated to all tuna RFMOs. CCSBT requested some additional information on the ecosystem component, but no objections have been received to date from our sister organisations.

It should be noted that the proposals were not rejected outright and it was indicated that the possibility of funding by the FAO Common Oceans/ABNJ Tuna Project these activities remained. In addition, the Project set aside  $\in$  300,000 in concept of *Support to replicate Shark By-catch activities area of ICCAT/IOTC*. Further details on this foreseen activity were not available at the time, but it was noted that ICCAT could put forward proposals under this line item for consideration. Such proposals should be developed by the SCRS.

# Appendix

# Activities proposed by ICCAT for the work plan and budget for Project year four Common Oceans ABNJ Tuna Project 2017/18

# **Output 1.1.2**

# Second Joint T-RFMO FAD Working Group Meeting

The 1<sup>st</sup> Joint T-RFMO Fad Working Group Meeting took place in Madrid, between19-21 April 2017. In total, 35 Contracting Parties from three t-RFMOs (ICCAT, IOTC and IATTC) attended the meeting, together with eight Non-governmental Organisations and entities, totalling 140 participants. In addition to revising the most up to date knowledge as regards FAD fisheries related issues, a list of key areas for future action for the joint t-RFMO FAD Working Group were discussed by the Group. It was the general opinion that the process conducted during the meeting was extremely productive and it was recommended that a technical working group on FADs should be created under the KOBE process to continue the work initiated during the 1st joint t-RFMO FAD meeting. Moreover, the 2nd Joint t-RFMO FAD Working Group meeting should be held in 2018 under the coordination of ICCAT. The envisioned budget for this task would be on the order of €180,000\* to organize a 1<sup>st</sup> meeting of the Technical Working Group on FADs (€30,000), and to organize the 2<sup>nd</sup> joint t-RFMO FAD meeting (€50,000) and support the attendance of the selected participants from developing Contracting Parties of the three t-RFMOS (€100,000).

\* In 2017 ICCAT benefited from  $\notin$  50,000 funding by the EU to organize the meeting, and  $\notin$  100,000 by the ABNJ tuna project which supported the attendance of some of the participants from developing CPs of the three t-RFMOs. The EU funding for the 2<sup>nd</sup> joint t-RFMO FAD meeting is not guaranteed for 2018.

# Total requested €180,000

[Note: ICCAT understands that  $\notin$ 150,000 towards the 2nd joint t-RFMO FAD and the support of the attendance of the selected participants from developing Contracting Parties has been approved, but that the funding for the Technical Working Group is subject to agreement of the other tuna RFMOs]

# **Output 1.1.4**

#### Proposed meeting of the tRFMO MSE Working Group

A key finding of the Mid-Term Evaluation of the ABNJ Tuna Project was that there is a clear need for followup to the regional and global workshops (on both HS/MSE) conducted under the project to strengthen understanding, and to continue to improve the linkage between scientists and managers and decision makers within and between t-RFMOs. The key challenge is how to communicate and promote HS and EAFM/EBFM most effectively with fisheries managers, and the Project needs a more structured, strategic approach towards raising awareness and training on HS and EAFM/EBFM, which will require greater input from communications staff on the Project (see below). However, in addition to building capacity through workshops the Project should help deliver targeted actions that result in a specific deliverable that is working towards a commonly agreed goal, e.g. set of guidelines, or model for testing.

In addition, a specific recommendation from that report was to identify specific opportunities for project support for follow-up activities for the Joint MSE Technical Working Group being led by ICCAT (this would also allow opportunity for the Project to rebalance activities between the t-RFMO), which could include developing a standard operating model to enhance suitable management plans for tuna stocks as a specific product deliverable.

As such ICCAT would like to propose that several activities be funded by the ABNJ Project in 2017 and 2018 to address some of these issues raised during the mid-term report:

- 1. Another meeting of the joint t-RFMO MSE Working Group. The aim of this meeting will be to continue the work being conducted by the Joint MSE Technical Working Group. As all t-RFMOs are advancing on their MSE processes, this meeting will be important to continue the momentum being developed. The object is to continue to provide a mechanism for sharing of experiences. To this end it is intended that a meeting be held to evaluate the progress made intersessionally since the previous meeting in 2016. A key outcome of the latter meeting was the development of work plans on key themes. These work plans should be evaluated and updated, while work on software and code should be revised. This meeting will be coordinated by the ICCAT Secretariat in conjunction with the Common Oceans ABNJ Tuna Project. Participation will be similar to the past meeting with participants from each t-RFMO and invited relevant experts. Attendees should again cover a range of stakeholders, i.e. not just modeller but people who have an interest in the results. This list would be drawn up by the t-RFMO-MSE Chair and the Global Coordinator for the ABNJ. The workshop should be scheduled for early 2018. Final dates need to be determined as soon as possible, in order to ensure the availability of participants. Once the date has been set, the venue will be determined. To allow time to achieve the work programme, a full week for workshops and discussions is considered necessary. The deliverable from this meeting should be to elaborate a set of guidelines, or models for testing. Envisioned budget - €70,000.
- 2. Peer/external review of MSE processes in the RFMOs. The success and sustainability of the MSE work within the RFMOs is dependent on the confidence the managers have in the advice being provided. With several of the RFMOs in an advanced state of development of HCRs and the MSE to evaluate them, rigorous review of the code used to conduct the MSEs is necessary. The process has been advanced by several manager-scientist dialogue meeting within the RFMOs, but equally important to the process is the revision of the software and code used to conduct the MSE. ICCAT for example would require a review of the northern albacore MSE code. This could then be published and made available to other RFMOs as a tool to conduct similar exercises. This could contribute to the observation made in the midterm review regarding developing a standard operating model to develop suitable management plans for tuna stocks. The envisioned budget for this task would be around €100,000 to contract external experts to review code for several different RFMO MSEs.
- 3. For consideration To organize a set of capacity building courses aiming to enhance participation of scientists and managers of developing countries on the MSE processes which are currently being developed in the different t-RFMOs. A group of core scientists, mostly from developing Contracting Parties, will be involved in a course to take place throughout a one year period (e.g. including attending three specific workshops and conducting intersessional work; these workshops will began with the basics of MSE followed by more advanced aspects of the MSE process). As such, scientists would have the chance to develop their expertise between intersessions and enhance their participation on the MSE processes being currently carried out. The second component would be dedicated to managers and would cover two major components: 1. what is expected from managers as regards the MSE process; 2. to present them a shiny app to allow them to play and understand own MSE works. The envisioned budget for this task would be around **€80,000** to organize the workshops/courses, contract the experts/instructors and support the attendance of the selected participants.

#### Total requested: €250,000

[Note: ICCAT understands that only  $\notin$  50,000 to hold the meeting under (1) above have been approved, but activities under 2 and 3 are subject to agreement by other tRFMOs]

# Output: 1.1.5

# Ecosystem Component: Common Oceans ABNJ Tuna Project

At the 2016 ICCAT Sub-committee on Ecosystem and By-catch meeting, substantial discussions were held, building on the work initiated in 2013 and continuing through into the work plan for 2017, regarding the implementation of Ecosystem based fisheries management (EBFM). ICCAT is moving along a line to increase the understanding of the concept amongst its members, and how the work being conducted by the various Scientific Committee Species Groups can feed into and compliment the process. Although "ecosystem-based management" can have very different meanings to different people, the Sub-committee is endeavouring to provide operational steps to facilitate a common understanding of the concept. Additionally, the Sub-committee discussed the level of detail that would be necessary for practical implementation of an EBFM. It was acknowledged that ICCAT, and in fact most RFMOs are conducting activities that could be considered part of EBFM. The process has yet to be formalized or clearly defined.

In 2016, noting that the FAO Common Oceans ABNJ Tuna Project, funded by the Global Environmental Facility, was promoting and supporting the preparation of long-term plans for operationalizing the ecosystem approach in fisheries in each of the t-RFMOs, encouraging consideration of the impacts of fishing activities, the Sub-committee agreed to develop an ICCAT led proposal for this component of the Project. It was agreed that the ABNJ Project could provide support for joint meetings of the t-RFMOs led by ICCAT to discuss experiences and proposed approaches to implement the EBFM. The first of these meetings was carried out in December 2016 at the FAO headquarters in Rome, with the financial support of the Common Oceans ABNJ Tuna Project. The objective of the first of these meetings was to establish dialogue between other RFMOs on the issue of EBFM and its implementation, while inviting several external experts on EBFM to provide input and guidance on this process. The meeting was considered a success by the participants and representation was achieved from all the tRFMOs.

It was noted, however, that the process is ongoing and substantial additional work is required. At that stage, The Common Oceans ABNJ Tuna Project pledged its support for an additional meeting, tentatively in mid December 2017 or beginning of 2018. This meeting would need to be different in terms of participants, engaging Commissioners. Participants proposed a three day meeting (including one or two days with Commissioners and one additional day for scientist to process and elaborate. Thus, a mix between scientists and managers is required to continue to advance the process, much like what has been done for Management Strategy Evaluation.

The proposed budget for this second workshop is **US\$100,000** in order to cover the travel expenses (including flights and per diem) of 15 individuals (2 from each of CCSBT, IATTC, ICCAT, IOTC and WCPFC Secretariats and 5 external experts), the time and expenses of the workshop coordinator, meeting preparation and hosting costs, as well as associated consumables required during the meeting. Future workshop budgets will be determined based on identified needs and participations.

However, it is also clear that although some progress is being made, the Mid-Term Evaluation of the ABNJ Tuna Project clearly stated that although the Project supported the Joint t-RFMO workshop on the implementation of ecosystem based fisheries management in December 2016 and ICCAT has advanced the considerations of EAF plans by identifying key elements needed to operationalize EAF plans and conducted comparisons with the approaches taken by other RFMOs. However, there has also been limited achievement of Outcome 2 (Roadmaps to operationalise EAFM/EBFM in t-RFMOs developed and submitted for adoption) with no development, to date, of any EAFM/EBFM plans. It goes on to state that the Project is supporting a number of open-ended processes, some of which are being led by partners (i.e. not the Project), such as support to the ICCAT-led workshops on EAFM/EBFM, which will continue after the Project finishes, and, as yet, it is not clear how sustainability of these initiatives will be secured.

Thus it is clear that substantial additional work is required under the ABNJ Project to ensure the EBFM progress is sustainable. The support for an EAFM/EBFM study group, to plan the way forward for this crucial work is also therefore highly desirable. ICCAT would like to open the discussion on the possibility for the Common Oceans ABNJ Tuna Project funding for this group, entailing further virtual and face to face meetings. The former will require funding in terms of cloud sharing tools (for maintaining and sharing the key inputs/documents for this work), as well as additional funding for an expert Technical Working Group to discuss the future of the EBFM work after the Project finishes. This will be conducted after the meeting described above, once input from the managers has been received and synthesized. The budget for this ongoing work will need to be planned in conjunction with the ABNJ staff depending on the envisioned needs of the process.

The estimated costs required to the Common Oceans ABNJ Tuna Project is:

Follow-up meeting in 2017/2018 – **US\$100,000** Cloud computing and sharing tools – **US\$5,000** Expert Technical Working Group to discuss the future of the EBFM – **US\$80,000** 

# Total Requested: €185,000

[Note: ICCAT understands that only  $\notin$  50,000 towards holding the follow-up meeting in 2017/2018 have been approved, but the remaining funds required, as well as funding for cloud computing and sharing tools and the expert Technical Working Group are subject to agreement by other tRFMOs]

# **Output 2.1.4**

# Support for ICCAT Port Inspection Expert Group for Capacity Building and Assistance

Given the setbacks in trying to implement the minimum standards for Port Inspection adopted by ICCAT through Recommendation 12-07, ICCAT adopted, in 2016, Recommendation 16-18 which establishes a Working Group to identify the needs of developing States and, *inter alia*, adapt training materials and programmes to reflect specific requirements of the ICCAT port inspection scheme. The first meeting of this Working Group will take place in Madrid in October 2017. Assistance for participants from developing countries is requested, as well as funding for the participation of one expert from IOTC.

The estimated costs are:

DSA in Madrid for up to 20 participants	19,520
Tickets for up to 20 participants	34,000
Bank charges	460
Total	€53,980

The above does not include the expert from IOTC, for which a cost of approximately €5,000 is envisaged.

A Letter of Agreement is currently being drawn up between FAO and ICCAT to cover the assistance for participants.

#### Total requested: €59,000

[Note: This has already been approved and is underway]

# **Appendix 15**

# **Opening Address by Mr Driss Meski, ICCAT Executive Secretary**

Mesdames et Messieurs les délégués scientifiques, Mesdames et Messieurs,

C'est pour la 14<sup>ème</sup> année consécutive que je suis les travaux de ce Comité scientifique dont l'importance est capitale pour notre Commission. J'ai eu donc suffisamment de temps pour apprécier le sérieux de ce Comité, ses exigences et faire face à quelques complications inhérentes au fonctionnement de ce genre.

Il est fort probable que ce soit ma dernière participation à votre réunion et je voudrais saisir cette occasion pour vous faire part de mes sentiments au terme de mon mandat.

Je suis très honoré d'avoir exercé les fonctions de Secrétaire exécutif de l'ICCAT durant trois mandats et je me réjouis d'avoir le sentiment d'avoir réussi l'exercice de mes fonctions.

Comme dans toutes les carrières, personne n'est en mesure de satisfaire les exigences de tout le monde, autrement on serait dans un monde parfait.

Contrairement à ce que l'on pourrait penser, j'ai toujours apprécié les travaux du SCRS, étant moi-même de formation scientifique, et j'ai toujours défendu l'idée de doter ses activités d'une enveloppe budgétaire incluse dans le budget du Secrétariat.

Comme plusieurs délégations ne partagent pas ce point de vue, étant donné que cela augmente les contributions, les actions du SCRS sont toujours tributaires des contributions volontaires des CPC.

Je me suis donc toujours retrouvé dans une situation, où je dois concilier entre ma position de gestionnaire et les recommandations scientifiques auxquelles j'ai toujours adhéré. Dans plusieurs cas, j'apparaissais antiscientifique, comme plusieurs de mes collègues me l'ont fait comprendre.

Je crois personnellement que j'ai fait mon travail avec honnêteté, clarté et transparence conformément aux règles de fonctionnement et ai contribué au bon fonctionnement de l'ICCAT et de ses comités. Je souhaite de tout mon cœur que mon successeur fasse mieux que moi et vous donne plus de satisfaction.

Pendant mon mandat, j'ai peut-être toujours parlé, j'apparais souvent seul à la présidence, je signe tous les documents que vous recevez mais vous voyez très peu les équipes qui sont derrière tout ce travail. L'ICCAT a le privilège d'avoir un secrétariat unique au monde. Des équipes très compétentes chacune dans son domaine. Des équipes qui travaillent sans relâche et à tout moment si elles sont sollicitées. Des personnes honnêtes. Je voudrais rendre hommage à tout le personnel du Secrétariat pour tout le travail qu'il a fait pour moi et pour l'ICCAT et je suis très reconnaissant de toute son assistance. Toute l'équipe sans exception mérite toute ma gratitude.

Je voudrais exprimer un remerciement particulier à M. Juan Antonio Moreno, le doyen de l'équipe pour son soutien indéfectible durant les 14 années de mon mandat.

Ma reconnaissance va aux interprètes qui font presque partie du personnel. Enfin, comme vous le savez certainement, deux grands cadres professionnels arrivent à l'âge de la retraite et je suis malheureusement contraint d'appliquer le règlement intérieur du Secrétariat.

Il s'agit de notre ami Laurence Kell et d'Antonio Di Natale. Ce sont des cadres de grande valeur que vous connaissez tous depuis plus de 20 ans.

Laurie est un excellent professionnel spécialisé dans les modèles d'évaluation des stocks. Il a rendu de grands services à l'ICCAT et nous espérons bénéficier de ses services sous d'autres formes dans le futur.

Antonio di Natale est un grand chercheur spécialisé dans le thon rouge. Personne ne peut prétendre connaitre le thon rouge dans tous ses détails comme le connait Antonio. Cela fait plus de 7 ans qu'il dirige de main ferme le GBYP. Malgré de grandes difficultés, Antonio a tiré le maximum de ce programme. C'est grâce à lui que ce programme continue à survivre. Il sera difficile de lui trouver un successeur mais on fera ce que l'on peut en comptant sur ses conseils dans le futur.

À tous les deux je leur souhaite bonne chance et je les remercie pour tout ce qu'ils ont fait.

Enfin je voudrais m'excuser auprès des personnes qui pourraient penser que j'ai été maladroit envers elles mais je les rassure que cela n'a jamais été mon intention ni ma volonté. Enfin, je voudrais remercier Miguel Santos pour avoir pris en charge beaucoup d'activités ces derniers temps.

Je vous remercie et à bientôt.
