# **REPORT OF THE STANDING COMMITTEE ON RESEARCH AND STATISTICS (SCRS)**

# (Madrid, Spain, 2 to 6 October 2017)

October 2017

## **REPORT OF THE STANDING COMMITTEE ON RESEARCH AND STATISTICS (SCRS)**

(Hotel Weare Chamartin - Madrid, 2-6 October 2017)

#### **TABLE OF CONTENTS**

- 1. Opening of the meeting
- 2. Adoption of Agenda and arrangements for the meeting
- 3. Introduction of Contracting Party delegations
- 4. Introduction and admission of observers
- 5. Admission of scientific documents
- 6. Report of Secretariat activities in research and statistics
- 7. Review of national fisheries and research programmes
- 8. Executive Summaries on species:

YFT-Yellowfin, BET-Bigeye, SKJ-Skipjack, ALB-Albacore, BFT-Bluefin, BUM-Blue marlin, WHM-White marlin, SAI-Sailfish, SWO-Atl. Swordfish, SWO-Med. Swordfish, SMT-Small tunas, SHK-Sharks

- 9. Report of inter-sessional SCRS meetings
  - 9.1 Meeting of the ICCAT Working Group on Stock Assessment Methods
  - 9.2 Small tuna Species Group intersessional meeting
  - 9.3 Tropical Tuna Species Group intersessional meeting
  - 9.4 Albacore Species Group intersessional meeting (including stock assessment of Mediterranean albacore)
  - 9.5 Shortfin mako shark data preparatory and assessment meetings
  - 9.6 Atlantic swordfish data preparatory and assessment meetings
  - 9.7 Bluefin data preparatory and stock assessment meetings
- 10. Report of Special Data Collection and Research Programmes
  - 10.1 Atlantic-Wide Research Programme for Bluefin Tuna (ICCAT GBYP)
  - 10.2 Enhanced Billfish Research Programme (EBRP)
  - 10.3 Small Tunas Year Programme (SMTYP)
  - 10.4 Shark Research and Data Collection Programme (SRDCP)
  - 10.5 Atlantic Ocean Tropical tuna Tagging Programme (AOTTP)
- 11. Report of the Sub-committee on Statistics
- 12. Report of the Sub-committee on Ecosystems and By-catch
- 13. Considerations of implications of the Meeting of the Joint t-RFMO FAD Working Group
- 14. Report of the Third meeting of the Ad Hoc Working Group on FADs
- 15. Considerations of implications of the Meeting of the Standing Working Group on Dialogue between Fisheries Scientists and Managers (SWGSM)
- 16. Progress related to work developed on MSE
  - 16.1 t-RFMO MSE Working Group
  - 16.2. Work conducted under ICCAT GBYP
  - 16.3. Work conducted for other species
- 17. Report on the implementation of the Science Strategic Plan for 2015-2020 in 2017 and work plan for 2018, which includes the update of the stock assessment software catalogue

- 18. Consideration of plans for future activities
  - 18.1 Annual Work Plans
  - 18.2 Inter-sessional meetings proposed for 2018
  - 18.3 Date and place of the next meeting of the SCRS
- 19. General recommendations to the Commission
  - 19.1 General recommendations to the Commission that have financial implications
  - 19.2 Other recommendations
- 20. Responses to Commission's requests
  - 20.1 Ghana's comprehensive and detailed capacity management plan on the level of catches. Rec. 16-01, paragraph 12c
  - 20.2 Evaluate the efficacy of the area/time closure referred to in paragraph 13 in relation with the protection of juveniles of tropical tunas. Rec. 16-01, paragraph 15
  - 20.3 Review its 2016 recommendations on observer coverage and advise the Commission on appropriate coverage levels. Rec. 16-01, paragraph 42
  - 20.4 Recommendations made by the FAD Working Group (Annex 8) and develop a work plan. Rec. 16-01, paragraph 49 (a)
  - 20.5 Provide performance indicators for skipjack, bigeye and yellowfin tuna, with the perspective to develop management strategy evaluations for tropical tunas. Rec. 16-01, paragraph 49 (b)
  - 20.6 Develop a table that quantifies the expected impact on MSY, B<sub>MSY</sub>, and relative stock status for both bigeye and yellowfin resulting from reductions of the individual proportional contributions of major fisheries to the total catch. Rec. 16-01, paragraph 49 (c)
  - 20.7 Evaluate the contribution of by-catches and discards to the overall catches in ICCAT tropical tuna fisheries, on a fishery by fishery basis. Rec. 16-01, paragraph 53
  - 20.8 Advise the Commission on possible measures allowing to reduce discards and to mitigate onboard post-harvest losses and by-catch in ICCAT tropical tuna fisheries. Rec. 16-01, paragraph 53
  - 20.9 Provide information and guidance on enhancing efforts to address any deficiencies identified regarding fisheries for which biological sampling rates that should be increased and fisheries for which improvements in the collection and/or provision of statistical data are necessary to support the stock assessment. SCRS to report efforts made to enhance biological sampling activities. Rec. 16-08, paragraph 20
  - 20.10 The SCRS shall review new available information related to the identification of specific spawning times and areas of bluefin tuna within the western Atlantic Ocean, and advise the Commission on the results for its consideration. Rec. 16-08, paragraph 23
  - 20.11 Provide guidance on a range of fish size management measures for western Atlantic bluefin tuna and their impact on yield per recruit and spawner per recruit considerations. To comment on the effect of fish size management measures on their ability to monitor stock status. Rec. 16-08, paragraph 27

- 20.12 Mauritania will conduct research activities in cooperation with an ICCAT CPC of its choice, and will be subject to the presentation of a specific programme to the SCRS. The result will be made available to the Commission. Rec. 14-04, paragraph 5
- 20.13 Provide the Commission with the confirmed average round weight and gilled and gutted weight, corresponding to the LJFL of 100 cm. Rec. 16-05, paragraph 16
- 20.14 Continue to monitor and analyze the effects of the minimum size measure on the mortality of immature swordfish. Recs. 16-03, paragraph 10 and 16-04, paragraph 7
- 20.15 Develop a new data collection initiative as part of the ICCAT Enhanced Program for Billfish Research to overcome the data gap issues. Rec. 15-05, paragraph 10 and Rec. 16-11, paragraph 3
- 20.16 Refine the testing of candidate reference points (e.g. SSB<sub>THRESHOLD</sub>, SSB<sub>LIM</sub> and F<sub>TARGET</sub>) and associated harvest control rules (HCRs) that would support the management objective expressed in paragraph 2 of Rec. 16-06. The SCRS shall also provide statistics to support decision-making in accordance with the performance indicators in Annex 2. Rec. 16-06, paragraph 11
- 20.17 The HCRs referred to in paragraph 13 of Rec. 16-06 should be evaluated by the SCRS through the management strategy evaluation process, including in light of new assessments of the stock. Rec. 16-06, paragraph 14
- 20.18 Provide with a summary of the scientific data and information collected and reported pursuant to Rec. 16-14 and any relevant associated findings. Recommend on how to improve the effectiveness of scientific observer programs, including possible revisions to Rec. 16-14 and/or with respect to implementation of these minimum standards and protocols by CPCs. Rec. 16-14, paragraph 12 c and d
- 20.19 Review Rec. 14-09 and consider revisions to improve its effectiveness. To inform this review, the SCRS is requested to provide advice on the VMS data that would most assist the SCRS in carrying out its work, including frequency of transmission for the different ICCAT fisheries. Rec. 14-09, paragraph 7
- 20.20 Confirmation by the Shark Species Group regarding exemption of the necessity for data submission by CPCs. Rec. 16-13, paragraph 2
- 20.21 Develop rules of procedure, including a code of conduct for scientists and observers. Rec. 13-12, paragraph 1
- 20.22 Conversion algorithm for the caging operations. Rec. [14-04] Annex 9, item iii

#### 21. Other matters

- 21.1 Collaboration with other International Organizations (ICES, CITES, GEF, etc.)
- 21.2 Consideration of implications of the Fifth Meeting of the Working Group on Convention Amendment and of the Meeting of the Ad Hoc Working Group to Follow up on the Second Performance Review
- 21.3 Update of the ICCAT glossary
- 21.4 Consideration of new publication guidelines: executive summaries, detailed reports and SCRS report
- 21.5 Peer review publication (SCRS documents): agreement with Aquatic Living Resources journal

#### 22. Adoption of report and closure

- Appendix 1SCRS AgendaAppendix 2List of SCRS Participants
- Appendix 2 List of SCRS Participants Appendix 3 List of SCRS Documents
- Appendix 5 List of SCR5 Documents
- Appendix 4 Report of the Atlantic-wide Research Programme for Bluefin Tuna (ICCAT/GBYP)
- Appendix 5 Report of the Enhanced Programme for Billfish Research (ICCAT/EPBR)
- Appendix 6Report of the Small Tunas Year Programme (ICCAT SMTYP)
- Appendix 7 Report of the Shark Research and Data Collection Programme (ICCAT/SRDCP)
- Appendix 8 Report of the Atlantic Ocean Tropical Tagging Programme (ICCAT/AOTTP)
- Appendix 9 Report of the Sub-committee on Statistics
- Appendix 10 Report of the Sub-committee on Ecosystems and By-catch
- Appendix 11 List of Statistical and Tagging Correspondents by Country
- Appendix 12 2018 Work Plans of Species Groups
- Appendix 13 Preliminary budget for the implementation of the MSE Work Plan
- Appendix 14 Activities and proposals related to the Common Oceans/ABNJ tuna project
- Appendix 15 Opening Address by Mr Driss Meski, ICCAT Executive Secretary

# **REPORT OF THE STANDING COMMITTEE ON RESEARCH AND STATISTICS (SCRS)**

(Madrid, Spain – 2 to 6 October 2017)

#### **1. Opening of the meeting**

The 2017 meeting of the Standing Committee on Research and Statistics (SCRS) was opened on Monday, 2 October, at the Hotel Weare Chamartín in Madrid by Dr David Die, Chair of the Committee. Dr Die welcomed all the participants to the annual meeting.

The ICCAT Executive Secretary, Mr. Driss Meski, in his opening address underlined the role of the SCRS work, which he has been following for the past 14 consecutive years. He congratulated all the scientists for their great job. He mentioned that given that this meeting will probably be his last participation as Executive Secretary, he expressed his thanks to all scientists, the Secretariat staff and interpreters for their assistance over the years. He also informed the Committee that Drs Laurence Kell and Antonio Di Natale will soon retire, and expressed to them his gratitude for their work over the past 7 years at the Secretariat . The Opening Address of the Executive Secretary is attached as **Appendix 17**.

The Chair of the SCRS, Dr. David Die, thanked the Executive Secretary and the Secretariat for their cooperation and work throughout 2017 and their permanent support for the SCRS.

#### 2. Adoption of Agenda and arrangements for the meeting

The Tentative Agenda was revised and adopted with minor changes (**Appendix 1**). Full assessments were carried out this year on North and South Atlantic shortfin mako shark (SMA) stocks, Mediterranean albacore stock (ALB-Med), and North and South Atlantic swordfish (SWO) stock, and the Western and Eastern and Mediterranena bluefin tuna stocks (BFT). Also data preparatory meetings were held for bluefin tuna, shortfin mako and Atlantic swordfish this year, in preparation for the new assessments in 2017. Additionally, intersessional meetings were held for the Sub-Committee of Ecosystems and the Small Tunas and Tropical Tunas Species Groups, as well as the Working Groups on FADs and Dialogue between Fisheries Scientists and Managers. Finally, ICCAT organized the first joint t-RFMO meeting of the FAD Working Group.

The following scientists served as rapporteurs of the various species sections (Agenda Item 8) of the 2017 SCRS Report.

YFT BET SKJ ALB BFT BIL SWO SMT	- - - -	Yellowfin tuna Bigeye tuna Skipjack tuna Albacore Bluefin tuna General Billfishes Swordfish Small tunas	S. Cass-Calay H. Murua J. Amandé H. Arrizabalaga, J. Ortiz de Urbina (Med.) C. Porch, G. Melvin (West), A. Gordoa (East) F. Arocha R. Coelho (North), H. Andrade (South) G. Tserpes (Med.) N. Abid
SHK SBF	- -	Sharks Southern bluefin	E. Cortes

The Secretariat served as rapporteur for all other Agenda items.

#### 3. Introduction of Contracting Party delegations

The Executive Secretary introduced the 23 Contracting Parties present at the 2017 meeting: Algeria, Angola, Canada, China (P.R.), Côte d'Ivoire, European Union, Japan, Korea (Rep.), Liberia, Mauritania, Mexico, Morocco, Namibia, Nigeria, Norway, Russian Federation, São Tomé and Príncipe, Senegal, South Africa, Tunisia, United Kingdom (O.T.), United States and Uruguay. The List of Participants at the Species Groups Meetings and the Plenary Sessions is attached as **Appendix 2**.

#### 4. Introduction and admission of observers

Representatives from the following Cooperating non-Contracting Party, Entity, or Fishing Entity (Chinese Taipei), inter-governmental organizations (Food and Agricultural Organization – FAO) and non-governmental organizations (Federation of Maltese Aquaculture Producers – FMAP, Humane Society International – HIS, , International Seafood Sustainability Foundation – ISSF, Pew Charitable Trusts, The Ocean Foundation, The Shark Trust and World Wildlife Fund – WWF) were admitted as observers and welcomed to the 2017 SCRS (see **Appendix 2**).

#### 5. Admission of scientific documents

The Secretariat informed the Committee that 227 scientific papers and 47 scientific presentations had been submitted at the 2017 intersessional meetings. In 2016 a deadline of seven days before the beginning of the species groups meetings was established for submitting titles and abstracts and five days before the meeting to submit the full document. The objective of this deadline is to facilitate the work of the rapporteurs in preparing the meeting. Taking into account the limited time that the Groups have to complete their work, adherence to deadlines greatly contributes to improving the work of the SCRS.

Besides the scientific documents, there are 15 reports of intersessional and regular Species Groups meetings, 42 Annual Reports from the Contracting Parties, and non-Contracting Cooperating Parties, Entities and Fishing Entities, as well as various documents by the Secretariat. The List of SCRS Documents and Presentations is attached as **Appendix 3**.

#### 6. Report of Secretariat activities in research and statistics

The Secretariat presented information contained in the 2017 Secretariat Report on Research and Statistics related to fisheries and biological data submitted for 2016, including revisions to historical data. The activities and information included in this report refer to the period between 1 December 2016 and 12 September 2017 (the reporting period). Regarding the activities conducted by the Secretariat, in the most recent years, in addition to the normal activities developed on statistics, publications, data funds management and others, the Secretariat is dedicating (apart from the usual preparation of the majority of the datasets required by each assessment) a lot of additional work to stock assessment activities, whether participating actively in the assessment or coordinating and managing external support to the SCRS work. The Secretariat reiterated to the CPCs the Commission's requirement of using the most recent standard electronic forms for data submission and complete all the information requested.

The overall reporting ratio of Task I T1FC for 2016 increased slightly to 72% (53 flag CPCs), with 6 flag CPCs having late submissions. All the T1NC datasets received from 63 flag CPCs (85% reporting ratio), including the 6 flag CPCs with late-reports, were processed and presented to the SCRS. The deficiencies/problems with the Task II Catch and effort data (T2CE) were also noted, which has serious implications for the estimation of related datasets such as CATDIS, EFFDIS, CAS and CAA. The Secretariat also presented a new Global fisheries Scoreboard on basic data availability. This facilitates the quick review of the data available for stock assessment purposes. The scoreboard ranks the different stock on a scale of 1 – 10 based on the availability of Task I and II information for that stock. In 2014, a new form (ST08-FadsDep) was created and distributed in response to Rec. 13-01 paragraph 2. This form was designed to capture information on the number of FADs actually deployed on a quarterly basis, by FAD type, indicating the presence or absence of a beacon associated to the FAD. This form was modified in 2016 and again in 2017 to include additional information pursuant to Rec. [15-01] and subsequently, Rec [16-01 paragraph 23]. The response to this form has been very low due to uncertainty in the requirements of the Recommendation. As such in 2018 the Secretariat will work with CPC scientists to modify and simplify these forms and address any uncertainties as required.

For the reporting period, the Secretariat has received by-catch and discard information, mainly from the recently adopted ST09-NatobPrg data submission forms as the vast majority of by-catch information recorded by CPCs comes from observer programmes. It was stressed that all future by-catch data submissions should be made using the observer data collection forms. It was however noted that the submission of observer data has been generally poor due to the complexity of the ST09 forms. As such the Secretariat, in cooperation with CPC scientists and the Sub-Committees on Statistics and Ecosystems has provided a significant revision to this form for adoption by the SCRS in 2018.

The Committee was presented with an update of the various ICCAT publications. The deadline for documents was met with less than optimal success. Currently, the deadline is seven and five days before the meeting to submit titles and documents for the Species Groups. However, as with 2016, only around 50% of the documents have been submitted by the deadlines. The Committee was also informed of the intention of the Secretariat to only publish these documents electronically in the future to save costs and promote the rapid dissemination of the information. The ownCloud web server has now been used for three years by the SCRS and certain Commission meetings to share information, data, documents and models required to facilitate the work of the various groups and panels. The Secretariat has provided access details in advance of the meetings, to registered participants, so that they can access the necessary information prior to the commencement of the meetings.

During 2017, the Secretariat undertook an exhaustive work plan in terms of statistical related tasks, aiming to complete all the major SCRS demands and priorities for 2017. A reasonable part of the priority tasks were finalised in a timely manner, and the outcome used by the SCRS during 2017. However, several ongoing priority projects (RDBMS migration to MS-SQL server 2016, ICCAT-DB documentation framework, full revision of the tagging database system, improvements on the GIS system - shape files update, statistical databases deployment on the ICCAT cloud, etc.) have been partially implemented and in some cases postponed for 2018. It is important to note that, those postponed projects had no negative impact on the accomplishments of the SCRS requirements for 2017. The JAVA project which was initiated in 2015 (two years) was finalised and all the development made (unattended data integration software, web-form prototyping, ICCAT-DB improvements in structure and automation tools, improvement of various applications) was fully incorporated into the ICCAT-DB system.

The Secretariat has also begun work on addressing the Commission's request to provide the possibility for online reporting information. The Secretariat has already begun to develop tools to provide this possibility for the statistical data reporting forms. However, to extend this work to all the ICCAT reporting requirements is an extremely large undertaking that requires time and resources not currently available at the Secretariat. The work has been conducted internally within the Secretariat and, to a certain degree, in collaboration with the GEF-Common Oceans ABNJ Tuna Project. The Secretariat is also working with the ICCAT Online Reporting Working Group to ensure the various initiatives are coordinated and planned. The Online Reporting Working Group has primarily corresponded electronically. However, a physical meeting was also attended by members of the Secretariat staff.

The Secretariat has continued the series of periodic publications developed throughout the history of ICCAT, which includes: Volume 73 (9 issues) and 74 of the *ICCAT Collective Volume of Scientific Papers; Part I of the Biennial Period 2016-2017*, corresponding to Volume I (Commission meeting report), II (SCRS Plenary meeting report) and Volume 3 (Annual Reports); Volume 43 (II) of the Statistical Bulletin; and, Volume IV (Secretariat reports). The Secretariat highlighted the effort to publish until the end of 2017 all issues of volume 74 of the *ICCAT Collective Volume of Scientific Papers*. Having these papers published 3-4 month after the meeting they were presented is great improvement, but also a goal that can only be achieved if contributers strictly comply with the deadlines and guidelines for authors when submitting their papers.

In 2014 *Aquatic Living Resources* has changed its editorial line towards an ecosystem approach of fisheries management, which considerably reduced the possibilities of publishing the documents presented to the SCRS in this peer review journal. The field of interest of the journal in its new phase will continue to have an ecosystem approach, but with a broader outlook than in its last phase, which will open the publication up to a larger number of SCRS documents. In 2016 the Secretariat contacted the new ALR editorial team, ALR expressed their willingness to publish a few more ICCAT papers (12-15) on an annual basis. However, the SCRS failed to select a minimum number of papers for submission to ALR. To revert this situation the Secretariat together with the SCRS Chair prepared an alternative option for consideration of the SCRS (additional information in section 21.5).

The Committee acknowledged the extensive workload conducted by the Secretariat and thanked them for their support of the SCRS documentation processes. The Chair noted that the CPCs scientists should continue to work with and provide feedback to the Secretariat in order to maintain the productive functioning of the SCRS. The Committee noted that although there are still issues with the deadlines for submission of documents that needs to be improved further.

Ms. Mari Mishima who coordinated the ICCAT-Japan Capacity-Building Assistance Project (JCAP) during five years terminated her mandate in 2016. Since the last SCRS meeting, her duties are now a responsibility of the Secretariat. The JCAP trust fund has been dedicated to assisting developing CPCs to effectively implement ICCAT measures including those related to the monitoring, control and surveillance of tuna fishing activities as well as the improvement of data collection, analysis and reporting. Following the Secretariat presentation, the SCRS Chair and CPCs welcomed the outcome of the activities carried out this year and expressed their gratitude to the support of the JCAP toward capacity building of the developing CPCs. In response, Japan remarked that taking into account that this project is very much welcomed by the CPCs, they will make effort to keep contributing through JCAP for coming years while the budgetary situation is getting difficult year by year. Japan also expressed their wish for the project to take place in other regions and requested that CPCs help the Secretariat in finding experts that can be involved in the JCAP funded capacity building initiatives. The SCRS and the Secretariat expressed their appreciation to Japan.

#### 7. Review of national fisheries and research programmes

In accordance with the Revised Guidelines for the preparation of Annual Reports (ICCAT Ref. [12-13]), only information relative to new research programmes (Part I of the Annual Report) was presented to the Committee. The Committee considered the need to include information of interest for its work, separating it from the Annual Report which, with its current structure, is more geared to providing information to the Commission on compliance. The Committee reiterated the need to follow the Revised Guidelines for the preparation of the Annual Reports including the Summary Tables.

#### Algeria

Les captures algériennes des thonidés et des espèces voisines enregistrées pour l'année 2016 sont de l'ordre de 668.43 tonnes pour l'espadon, de 448.4 tonnes pour le thon rouge et 2313.948 tonnes pour les thonidés mineurs. En 2016, les statistiques de deux espèces de requins pêchées accessoirement ont été disponibles, il s'agit du requin à peau bleue « *Prionace glauca* » et du requin renard « *Alopias vulpinus* ».

La pêche au thon rouge vivant s'effectue par des navires thoniers senneurs battant pavillon algérien. Pour l'année 2016, 11 navires thoniers senneurs ayant satisfait aux exigences réglementaires pour participer à la campagne de pêche, dont la longueur des navires est comprise, entre 22 et 40 m. La flottille algérienne s'est organisée en groupe de pêche conjointe. La totalité du quota octroyé à l'Algérie a été capturé.

Un échantillonnage de 20 individus de thon rouge capturés morts durant la campagne de pêche a fait l'objet de mensuration de taille et de sexage. Le poids total des individus échantillonnés est de 1935 kg.

Pour l'espadon *Xiphias gladius*, des échantillonnages de taille et de poids ont été aussi été effectués au niveau des ports de débarquement.

S'agissant de la collecte des données statistiques de l'activité de pêche, le dispositif existant à l'échelle nationale contribue efficacement à l'alimentation et l'actualisation de la base de données au niveau de la Direction Générale de la Pêche et de l'Aquaculture. Ce dispositif est renforcé par la réalisation pour la troisième année consultative de deux campagnes d'évaluation des ressources pélagiques et démersales dans eaux algériennes annuellement.

Le volet recherche est pris en charge par le Centre National de la Recherche et du Développement de la pêche et de l'Aquaculture (CNRDPA) ainsi certaines universités nationales qui fournissent de l'information scientifique et les orientations pour les prises de décision de gestion des ressources halieutiques.

#### Canada

Bluefin tuna are harvested in Canadian waters from July through December. The adjusted Canadian quota for 2016 was 506.74 t which includes a 55.98 transfer from Mexico. A total of 700 licensed fishermen were active (i.e. licenses that had landings) in the directed bluefin fishery using rod and reel, handlines, tended lines, electric harpoon and trap nets to harvest 385.2 t. An additional 80.9 t was harvested as bycatch in the pelagic longline fleet in the swordfish and other tunas fishery. These figures include 8.7 t of mortality associated with tagging studies.

The swordfish fishery in Canadian waters takes place from April to December. Canada's adjusted swordfish quota for 2015 was 2040.2 t with landings reaching 1547.9 t. The tonnage taken by longline gear was 1462.6 t while 85.3 t were taken by harpoon. Of the 77 licensed swordfish longline fishermen, 43 were active in 2016. Only 161 of 1,157 harpoon licenses reported swordfish landings in 2016.

The other tunas (albacore, bigeye and yellowfin) are at the northern edge of their range in Canada and are harvested from May through October. In 2016, other tunas accounted for approximately 9%, by weight, of the commercial large pelagic species landed in Atlantic Canada.

The Canadian Atlantic statistical systems provide real time monitoring of catch and effort for all fishing trips targeting pelagic species. At the completion of each fishing trip, independent and certified Dockside Monitors must be present for off-loading to weigh out the landing, and verify log record data.

Canada continues to actively support scientific research such as; the reprocessing of acoustic data from the Gulf of St. Lawrence herring survey for bluefin tuna targets which yielded a new relative index of relative abundance, tagging of bluefin tuna that addresses questions related to mixing, migration and the distribution within the Canadian EEZ, the collection of Bluefin tuna otoliths and spines which will contribute to a mixing analysis, diet analysis and lipid analysis. For sharks, recent research has been focused on a conventional tagging program for incidental captures of blue, porbeagle and shortfin mako shark caught by charter and recreational fishermen and a fixed station longline survey designed to give abundance and distribution information for porbeagle shark.

## China (People's Rep.)

The number of vessels from China operated in the Atlantic Ocean increased from 24 in 2015 to 34 in 2016. The longline was the only fishing gear used to target bigeye tuna and bluefin tuna. The total catch of main species including bycatch was 7049.098 t (in round weight), 1207.6 t higher than that in 2015 (5841.5 t). The catch of bigeye tuna and bluefin tuna amounted to 5852.39 t and 53.89 t in 2016, respectively. The catch of bigeye tuna accounted for 83.02% of the total in 2016. Yellowfin tuna, swordfish and albacore tuna, etc. were taken as bycatch. The catch of yellowfin tuna was 467.746 t in 2016. The catch of swordfish was 357.277 t. The catch of albacore tuna was 197.565 t. The data compiled, including TASK I and TASK II as well as the number of fishing vessels, have been routinely reported to the ICCAT Secretariat by the Bureau of Fisheries (BOF), Ministry of Agriculture of PRC. PRC has carried out a national scientific observer program for the tuna fishery in ICCAT waters since 2001. Three observers in 2016 have been dispatched on board five Chinese longliners covering the fishing areas of S8°53'-N13°04', W01°26'-W44°39' (targeting bigeye tuna) and N52°41'-N50°28', W32°35'-W29°57' (targeting bluefin tuna). Data of target species and non-target species (sharks, sea turtles, especially) were collected during the observation.

## Côte d'Ivoire

Une quantité totale 2369.59t constituée de thonidés (1912,41 t), billfih (142,60 t) et requins (314,58 t) a été débarquée aux différents quais et ports par la pêche industrielle et artisanale qui exerce dans le milieu marin. Les thonidés ont été dominant avec 1912.41 t suivi des requins (314t) et billfish (142t). Le patudo, le marlin bleu l'auxide et le requin renard ont été dominant dans les captures. Les tailles moyennes calculées ne concernent que les individus issus de la pêche artisanale. En 2016, aucun dépassement de quota n'a été observé dans les espèces à quota et les recommandations ont également été appliquées dans la mesure du possible. En outre, compte tenue de l'importance des thonidés et les espèces capturées en association dans l'économie nationale et dans le souci d'une meilleure gestion du stock existant, une connaissance de la biologie et un renforcement du personnel enquêteur est indispensable.

Aussi, s'avère-t-il urgent de permettre à la Côte d'Ivoire d'être désormais partie prenante dans le programme de suivi des statistiques par la présence d'observateurs à bord des navires.

## European Union

Several Member States of the European Union (EU) have fleets actively fishing in the ICCAT Convention area. These are: Croatia, Cyprus, France, Greece, Ireland, Italy, Malta, The Netherlands, Portugal, Spain, and United Kingdom.

The EU fleet targets most of the species that are regulated by ICCAT i.e. eastern bluefin tuna, skipjack, yellowfin, bigeye, albacore, swordfish, marlins and sharks. Other groups of species such as small tunas (bullet tuna, Atlantic bonito, frigate tuna, little tunny and dolphinfish) are also caught by the EU fleets operating in the ICCAT Convention area. The EU fleet uses a wide range of fishing gears: purse seiners, baitboats, longliners, handlines, troll, harpoons, mid-water trawls, traps and sport fishing gear. The EU is one of the major players in the ICCAT area and its catches represent around 40% of the total catches of the ICCAT Contracting Parties.

This diversity also constitutes a concrete challenge in faithfully reporting on such variety, namely through Task I and II data, but also information on by-catches, interactions with associated species, the composition of fleets, etc. Despite the complexity of the tasks pertaining to the follow up of the reporting obligations involving the different Member States, the EU pays special attention to ensure a timely and complete submission of information by keeping them updated on the different ICCAT reporting obligations, clearly identifying data, deadlines, formats, and contact persons responsible for the compilation of reports and data submission to ICCAT.

#### Japan

The Fisheries Agency of Japan (FAJ) has set catch quotas for western and eastern Atlantic bluefin tuna as well as for southern albacore, northern and southern Atlantic swordfish, blue marlin, white marlin, spearfish and bigeye tuna, and has required all tuna vessels operating in the Atlantic Ocean to submit logbook and, for bluefin tuna, daily catch information. All Japanese longline vessels operating in the Convention area have been equipped with satellite tracking devices onboard. In accordance with ICCAT recommendations, FAJ has taken necessary measures to comply with its minimum size regulations, time area closures and so on by the Ministerial Order. A statistical or electronic catch document program has been conducted for each species. Records of fishing vessels larger than 20 meters in length overall (LSFVs) have been established. One patrol vessel was dispatched to the North Atlantic to monitor and inspect Japanese tuna vessels catching bluefin tuna and also observe fishing activities of fishing vessels from other nations. FAJ also inspected landings of Japanese fishing vessel at Japanese ports to enforce the catch quotas and minimum size limits. A prior authorization from FAJ is required in the case that Japanese tuna longline vessels transship tuna or tuna products to carriers at foreign ports or at sea.

## Korea (Rep. of)

In 2016, 11 Korean longline vessels engaged in fishing for tuna and tuna-like species in the Atlantic Ocean and the total catch was 2,801 t. The catches of bigeye tuna, yellowfin tuna and bluefin tuna were 562 t, 368 t and 161 t, respectively. Fishing grounds of Korean longline vessels have been formed at the tropical area of the Atlantic Ocean ( $20^{\circ}N \sim 20^{\circ}S$ ,  $20^{\circ}E \sim 60^{\circ}W$ ) throughout the year, and that of 2016 was almost the same as in the previous years. The observer coverage of logbook by Korean fleet in 2016 is estimated at about 13.4% of the total efforts (number of hooks) for longline fishery.

#### Liberia

This report covers the period of one year (from January 1 to December 31, 2016) and is divided into two parts; namely, part one (Information on Fisheries, Research and Statistics) and Part Two (General Management Information). Nominal catch is reported for the period under review as an appendix. Some management measures have been put in place to ensure the proper management of Liberia's tuna fisheries such as: tuna fisheries access agreement for foreign tuna fishing fleet, effective Monitoring Control and Surveillance Unit, VMS requirement for all tuna fishing vessels and a minimum of 15% Observer coverage for all tuna companies and daily reporting of catch by individual vessel to Liberia Fisheries Monitoring Center (FMC). Liberia signed a Sustainable Fisheries Partnership Agreement (SFPA) with the European Union (EU) in June 2015 for access to its EEZ to exploit tropical tuna resources.

#### Mauritania

En Mauritanie, les espèces de thons hauturiers sont ciblées uniquement par des flottilles étrangères travaillant dans le cadre des accords bilatéraux et opérant sous le régime de licence libre. Les flottilles de ces parties contractantes qui ont atteint en 2016 environ 62 thoniers débarquent leur production dans des ports étrangers.

Les espèces de thons côtiers sont pêchées accessoirement par les unités hauturières de petits pélagiques. Les statistiques montrent que la capture accessoire du thon hauturier réalisée par la pêche hauturière a atteint, en 2016, 8300 tonnes (soit une augmentation de 93% par rapport à 2015) composée essentiellement de *Sarda sarda* avec une contribution de 58% contre 30% pour *Euthynnus* sp et 12% pour *Auxis thazard*.

Les captures débarquées par la pêche artisanale et la pêche côtière ont subi une nette augmentation en 2016. Après la chute observée en 2014 pour une quantité inférieure à 500 tonnes composée essentiellement de *Scomberomorus tritor*. Un programme de suivi axé sur ces pêcheries sera mis en place pour renforcer la collecte des données sur les thons mineurs et tropicaux pendant les heures de la journée les moins couvertes par le Système de Suivi de la Pêche Artisanale et Côtière (SSPAC).

En fin plusieurs programmes de recherches axés sur l'étude de certaines espèces des thons ont été lancés par l'IMROP en 2016 et 2017 avec l'appui financier de l'ICCAT. Il s'agit en particulier d'un programme visant la collecte des données et les informations disponibles sur la présence des thons rouges dans la zone Mauritanienne en 2016 et un programme de collecte des données biologiques en vue d'étudier les structures des tailles et les paramètres de croissance mais le développement des approches de reconstitution des captures de ces espèces de 2000 à 2016 est toujours en cours.

## Morocco

La pêche des espèces de thonidés et des espèces apparentées a atteint une production de 9702,7 tm au cours de l'année 2016 contre 9120,9 tm au cours de l'année 2015 en termes de volume soit une augmentation de 7 %. Toutefois, le quota du thon rouge alloué par l'ICCAT a été consommé à 100 %. Les principales espèces exploitées le long des côtes marocaines sont le thon rouge, l'espadon, le thon obèse, l'albacore, le germon, les thonidés mineurs, autres thonidés et des requins et squales. La collecte de données statistiques de la production et de l'effort, se fait pratiquement d'une manière exhaustive, à travers les structures administratives des pêches (Secrétariat d'Etat chargé de la Pêche Maritime et l'Office National des Pêches), implantées tout au long des côtes atlantique et méditerranéenne du Royaume du Maroc. Un contrôle se fait également en aval par l'Office des Changes, en ce qui concerne les exportations des produits de la pêche. Sur le plan scientifique, l'Institut National de Recherche Halieutique -INRH-, à travers ses Centres Régionaux (au nombre de six), couvrant tout le littoral marocain, a renforcé la collecte de données biologiques des principales espèces (thon rouge et espadon). Le Centre Régional de l'INRH à Tanger sert de coordinateur de collecte de toutes ces données. Au cours de ces dernières années, d'autres espèces ont commencé à être suivies, notamment celles des thonidés tropicaux(thon obèse entre autres) et les thonidés mineurs, avec une extension des travaux de recherche vers les zones situées au Sud du Royaume du Maroc. Un grand progrès a été ainsi enregistré en matière de collecte de données statistiques et biologiques, tel qu'en témoignent la série de documents scientifiques, ainsi que des bases de données de la Tâche II, soumises par les chercheurs marocains aux différentes réunions scientifiques du SCRS, à des fins d'évaluation de stocks de thonidés.

## Mexico

Este informe describe las características de la pesca del atún aleta amarilla o rabil (*Thunnus albacares*) con palangre en el Golfo de México, y las especies que integran la captura incidental, haciendo énfasis en el cumplimiento a las regulaciones nacionales y/o aplicación de las recomendaciones y resoluciones emanadas de la Comisión Internacional para la Conservación del Atún Atlántico (CICAA).

La pesca de atún aleta amarilla o rabil en el Golfo de México se lleva a cabo por embarcaciones de mediana altura a través del palangre. Además de la especie objetivo, se capturan incidentalmente otras especies como: el barrilete o listado (*Katsuwonus pelamis*), el patudo o bigeye (*Thunnus obesus*), el atún aleta azul o atún rojo del Atlántico (*Thunnus thynnus*), tiburones y pez espada, entre otros.

El marco legal normativo que regula esta pesquería en México incluye a la Ley General de Pesca y Acuacultura Sustentables (LGPAS), y la Norma Oficial Mexicana NOM-023-SAG/PESC-2014 que regula el aprovechamiento de las especies de túnidos con embarcaciones palangreras en aguas de Jurisdicción Federal del Golfo de México y Mar Caribe la cual se actualiza periódicamente para incorporar las s regulaciones adoptadas por CICAA. La Secretaría de Agricultura, Ganadería, Desarrollo Rural, Pesca y Alimentación (SAGARPA) a través de la Comisión Nacional de Acuacultura y Pesca (CONAPESCA) es la autoridad nacional encargada de implementar las políticas, programas y normatividad que faciliten el desarrollo competitivo y sustentable del sector pesquero y acuícola de México. Por su parte, el Instituto Nacional de Pesca y Acuacultura (INAPESCA) es el responsable de desarrollar la investigación científica y recopilar las estadísticas sobre la pesca del atún con palangre en el Golfo de México.

#### Namibia

Namibia, as a member of ICCAT, strives to fully implement all ICCAT conservation and management measures. Foreign fishing vessels entering Namibian ports are thoroughly inspected to ensure that they have not contravened national laws and regulations of Namibia or those of other States, as well as conservation and management measures adopted by ICCAT and any other RFMOs or international organisation. In addition, monitoring measures are in place to ensure that all products coming from licensed tuna fishing vessels, when entering or leaving Namibia, are accompanied by the necessary documents.

In 2016, Namibia continued to undertake research on all ICCAT species caught by boats operating in Namibian waters. Data obtained from log sheets supplied to fishing vessels, as well as data collected by Fisheries Inspectors deployed at all landing points and those data collected by Fisheries Observers onboard fishing vessels were analysed and the results were submitted to ICCAT in June 2016 (Task I and Task II). The landings for some species, namely; albacore (ALB), bigeye tuna (BET) and longfin mako (LMA) have decreased in 2016 when compared to 2015, while those of swordfish (SWO), yellowfin tuna (YFT), blue shark (BSH), shortfin mako (SMA) and blue marlin (BUM) have increased in 2016 when compared to 2015. Other species, such as skipjack tuna (SKJ), were also recorded in 2016 (0.55 t).

Fisheries observers were also tasked to observe the activities of fishing vessels at sea and report any violations for possible action to be taken against the culprits. Furthermore, Namibia had deployed Fisheries Inspectors both at sea onboard Fisheries Patrol vessels and in the harbours, to ensure strict compliance with the country's rules and regulations related to the exploitation of marine living resources, including those adopted by Namibia as part of its obligations to RFMOs and international organisations.

#### Norway

Norway was allocated a quota of 43,71 t of eastern bluefin tuna (*Thunnus thynnus*) for 2016. The quota was exhausted in a directed ICCAT fishery and as bycatch in non-ICCAT fisheries. Numerous observations of Atlantic bluefin tuna were made along the coast and offshore waters of Norway from 58° to 68°N during August-November 2016. Norway put a lot of effort into obtaining biological, ecological and genetic samples and data from all individuals of Atlantic bluefin tuna caught in 2016. Norway continuously works on present and historical data on tuna and tuna-like species and aims to incorporate the data on these species into an ecosystem perspective. Norway participated in the SCRS annual science meeting in 2016.

#### Russia

*Fishery.* In 2016 and 2017 a specialized (purse-seine) tuna fishery fleet flying the Russian flag did not carry out any operations. In 2016 trawl vessels caught 1428 t of 4 tuna species and 850 t of Atlantic bonito as a by-catch in the Eastern-Central Atlantic. In the first half of 2017 the trawl vessels caught 173 t of 3 tuna species and 228 t of Atlantic bonito.

*Scientific research and statistics.* In 2016 "AtlantNIRO" observers collected biological and fishery materials on tunas onboard trawl vessels in the Eastern-Central Atlantic (area SJ71 according to the ICCAT classification). Fish length and weight were measured, fish sex, gonads maturity stages and stomach fullness degree were determined. Species of the group "small tunas" occurred in trawls as a by-catch from one individual specimen or up to a few dozens. Material on frigate tuna, bullet tuna, Atlantic black skipjack, oceanic skipjack and Atlantic bonito in the amount of 5405 specimens was collected for weight measurements and 1480 for biological analyses.

*Implementation of the ICCAT conservation and management measures.* In course of the fishery in the areas where tunas and tuna-like species occurred in the catches, the ICCAT requirements and recommendations concerning compliance with restrictions on tuna fishery and a ban on fishery of quoted species were applied.

#### Sao Tome and Príncipe

Sáo Tomé et Principe, pays insulaire, avec une ZEE de 160 000 km2, où le poisson représente la principale source de protéines animales consommées.

Il est important de dire que le pays a apporté quelques améliorations dans sa flottile mais il n'a pas encore atteint le niveau souhaité car il se tourne encore vers la pêche artisanale et semi-induvial. À l'heure actuelle, le pays compte 2305 navires artisanaux exploitant ZEE dans la zone de pêche artisanale, à 12 à 15 milles au large de la côte.

Dans la pêche d'espèces de grande valeur commerciale, la pêche du de thon et similaires est d'une importance majeure pour le STP. La pêche de thon et similaires est faite en PTS par des navires artisanaux, ceux qui ont la capacité de capture la plus élevée sont les Cariocos, les bateaux et certains bateaux de pêche semi-industrielle, dont 75 bateaux utilisant PSS et TROL et 10 semi-navires applications industrielles utilisant TROL.

Les données déclarantes depuis 2012, la pêche de thon et similaires cette année était de 2049 t, en 2013 avec 2105 t, 2014 t avec 2250 t, 2015 t avec 3273 t.

Les prises totales de thon et similaires de la flottile de STP en 2016 sont estimées à 4474 t dont 421 t pour BET, 167 t BIL, 207 t de BON, 91 t de BUM , 536 t de FRI, 122 t de FTA, 11 t de MAW, 212 t de SAI, 380 t de SKJ, 77 t de SWO, 70 t de WAH, 15 t de WHM et 301 t de YFT.

Le suivi des activités de pêche thoniers a STP, a été relancé en 2015 pour le Département de la recherche et de la statistique de la Direction des pêches avec le programme de soutien JACP qui continue jusqu'à présent. Dans le cadre du programme de recherche intensive sur les istiophoridés, la collecte des statistiques (captures et effort de pêche en nombre de sortie) et l'échantillonnage sont toujours menés au niveau des principaux ports de la pêche artisanale.

## Senegal

En 2016, la flottille thonière industrielle sénégalaise est composée de six (6) canneurs et quatre (4) senneurs qui exploitent essentiellement les thons tropicaux notamment l'albacore (*Thunnus albacares*), le thon obèse (*Thunnus obesus*) et le listao (*Katsuwonus pelamis*) et un (1) palangrier et de 2 petits cordiers qui ciblent l'espadon. Cependant, une partie des pêcheries artisanales qui utilise les engins de pêche tels que la ligne à la main, la ligne de traîne, la senne tournante et les filets capturent les poissons porte-épée (marlins et voilier) et les petits thonidés (thonine, maquereau, bonite, auxide etc.) et les requins.

Les prises totales de thons tropicaux des canneurs sénégalais sont estimées à 3 874 t dont 692 t d'albacore, 2 495 t de listao, 575 t de patudo, 108 t d'auxide et 3 t de germon. Les prises de thons tropicaux des senneurs sénégalais sont de 21 878 t. Les captures sont composées de 6017 t d'albacore, 14 092 t de listao, 895 t de patudo, 871 t d'auxide et 2 t de thonine. Pour la pêche palangrière sénégalaise ciblant l'espadon, les prises de 2016 sont estimées à 375 t dont 225 t d'espadon, 101 t de thons albacore, 35 t de requins, 12 t de marlin bleu et 2 t de coryphène. Pour les pêcheries artisanales de petits thonidés et espèces apparentées, les prises de 2016 ont été estimées à 8677 t et 1693 t de requins.

Le suivi des activités de pêche de tous les thoniers qui s'activent dans l'océan atlantique et qui fréquentent le port de Dakar, la collecte des données et l'échantillonnage au port sont toujours menés le Centre de Recherches Océanographiques de Dakar-Thiaroye (CRODT). Au niveau de la pêche artisanale, la collecte des statistiques (captures et effort de pêche en nombre de sortie) et l'échantillonnage des istiophoridés sont aussi réalisés au niveau des principaux ports de la pêche artisanale grâce au fond du Programme de Recherche Intensive des Istiophoridés (EPBR).

#### South Africa

The South African tuna and billfish resources are exploited by baitboat (tuna pole and line) and longline fisheries. The baitboat fleet consisted of 98 active vessels of an average 16 m length overall (LOA) fishing for 4908 catch days. Despite an increase in effort by seven vessels compared to 2015, the baitboat fishery saw an almost 50% decline in albacore (Thunnus alalunga) catch and a more than 30% decline in yellowfin tuna (Thunnus albacares) catch, resulting in a total 2016 catch of 2,001 t and 599 t, respectively. In 2016, 15 longline vessels were active in the Atlantic. These were exclusively South African flagged vessels, with all three active joint-venture (Japanese) vessels having fished exclusively in the Indian Ocean since 2014. Total longline effort in the Atlantic has decreased from 1187 thousand hooks in 2015 to 924 thousand hooks in 2016. The 2016 catches of swordfish (164 t), albacore (65 t), yellowfin tuna (107 t), bigeye tuna (111 t), shortfin mako shark (339 t) and blue sharks (356 t) have all decreased compared to 2015. Measures to reduce shark targeting to direct effort towards improved tuna and billfish catch have been included in the Large Pelagics Fishery Policy and have been fully incorporated into the fishery regulations since January 2017. The South African government (DAFF) is conducting independent research and is collaborating with universities, scientists from other CPCs and NGOs to optimise sustainable large pelagic fishing. Key research conducted in 2016 included the development and application of the Bayesian Surplus Production modelling software 'JABBA', the development and improvement of abundance indices of large pelagic species and involvement in multilateral bycatch estimation, genetics and life-history research programs. Research projects investigating the stock origin and intermixing of tuna and swordfish populations at the boundary between the Atlantic and Indian Oceans remain a high research priority in South Africa.

#### Tunisia

Les plans de gestion et de conservation des thonidés et des espèces accessoires sont régis essentiellement par les dispositions de la loi N° 94-13 du 31 Janvier 1994 et de ses textes d'application. En 2016, comme pour les années précédentes, ces plans ont été soutenus par la mise en œuvre de tous les programmes de contrôle (programme des observateurs à bord) et les programmes d'inspection en mer et dans les ports notamment pendant les périodes d'interdiction de la pêche de thon rouge et d'espadon. En préparation à la campagne de pêche de thon rouge 2016, la Tunisie a ajusté sa capacité de pêche conformément à la méthodologie adoptée par l'ICCAT (paragraphe 41-Rec 14-04). Sur la base de cette méthodologie, la Tunisie a établi un plan de pêche et a attribué des quotas individuels à 27 navires pour exercer la pêche au thon rouge en 2016.

Dans ce contexte et dans le cadre de l'amélioration de la collecte des statistiques de prise de thon rouge et le suivi de la mise en œuvre des mesures prises en vue d'atténuer les prises accessoires et les rejets dans les pêcheries thonières et d'espadon, l'autorité compétente, outre la documentation des captures, a couvert 5 % de ses pêcheries thonières et artisanales par des observateurs scientifiques. L'allocation de quotas pour la pêche de thon rouge et la perfection des engins ciblant l'espadon ont minimisé énormément les captures accidentelles sachant qu'en 2016 aucune prise accessoire de tortues marines ou de mammifères marins n'a été relevé par le programme des observateurs nationaux. Les captures totales du thon rouge en 2016 ont atteint 1490,6 tonnes, soit un taux de réalisation de 99,92 % du quota national ajusté à 1491,71 tonnes. Il est à signaler que les 2% de ces prises ont été capturées accidentellement.

Concernant la contribution au programme de recherche scientifique, la Tunisie effectue différentes activités de recherche sur le thon rouge, l'espadon et les thons mineurs. Ces activités sont définies tenant compte des recommandations de l'ICCAT et des priorités du SCRS.

## United Kingdom - OTs

The level of fishing effort in the United Kingdom Overseas Territories (UKOTs) engaged in ICCAT during 2016 was similar to that of 2015 in terms of vessels registered, with a slight decrease in the Bermuda fleet, but also a slight increase, in terms of vessels registered, with St Helena registering the first vessel over 20 meters in length to the UKOT fleet, as part of its efforts to expand its fishery. The total tonnage of ICCAT species caught in the UK OTs has remained modest when compared to more developed fisheries. Bermuda and St Helena continue to represent the largest contributors to the total UK OT catch, with much smaller catches in the British Virgin Islands and the Turks and Caicos Islands.

UK OT fishing activity is primarily artisanal or sports-related. There is no fishing involving larger scale methods utilising, for example, fish aggregating devices or purse seines, and only very limited deployment of longlines. However, the UKOTs continue with their interest in developing commercially viable fisheries to aid in their economic development.

The Territories recognise their responsibilities for the sustainable management of their natural environments and have been working with the UK Government to develop fisheries – including developing sustainable management plans and facilitating development of the fishing sector. The establishment of a robust management frameworks is, however, dependent upon long term investment, which is in turn reliant on the retention of some existing quotas and the potential for expansion in others (such as s. albacore or swordfish) which might come under pressure if fisheries were expanded.

## United States

Total (preliminary) reported U.S. catch of tunas (YFT, SKJ, BET, ALB, BFT) and swordfish, including dead discards, in 2016 was 6,737 t, an increase of about 15% from 5,847 t in 2015. Swordfish catches (including estimated dead discards) decreased from 1,718 t in 2015 to 1,522 t in 2016, and provisional landings from the U.S. fishery for yellowfin tuna increased in 2016 to 3,274 t from 2,074 t in 2015. U.S. vessels fishing in the northwest Atlantic caught in 2016 an estimated 1,025 t of bluefin tuna, an increase of about 126 t compared to 2015. Provisional skipjack tuna landings increased by about 56 t to 134 t from 2015 to 2016, bigeye tuna landings decreased by 298 t compared to 2015 to an estimated 533 t in 2016, and albacore landings increased from 2015 to 2016 by 3 t to 250 t.

U.S. government (NOAA) and university scientists, working independently or in collaboration (including collaborations with scientists from other CPCs), conducted research in 2016 involving a variety of ICCAT and bycatch species. Such research included larval surveys, the development of abundance indices, electronic and conventional tagging to investigate movements, habitat usage and post-release mortality, and the collection and analysis of biological samples to study topics such as age, growth, stock structure, spawning areas, fecundity, and genetics (including direct estimates of stock size). Additional topics included the influence of environmental factors on distribution and catch rates, and the development of stock assessment models.

## Uruguay

Durante el año 2016, la flota atunera uruguaya no mantuvo actividades. En lo que va del 2017 se presentaron a DINARA varios proyectos para la incorporación de nuevos buques a la pesquería de grandes recursos pelágicos, por lo que se espera una recuperación del sector a partir de finales del 2017. Se continuó con el análisis de estadísticas de captura y esfuerzo de las especies de interés de la Comisión. Se realizaron dos campañas de investigación, a bordo del B/I de DINARA, dirigidas a grandes recursos pelágicos. Durante las mismas se registró la captura, se realizaron muestreos de talla y sexo, se tomaron muestras biológicas, se continuó con el Programa de Marcado convencional y con el Programa de marcado satelital (Thunnus albacares, Prionace glauca, Isurus oxyrinchus, Lamna nasus y Diomedea epomophora). También se realizaron experimentos para evaluar medidas de mitigación de la captura incidental. Uruguay participó y aportó trabajos en diversas reuniones del SCRS, incluyendo la reunión intersesiones del Comité de Cumplimiento de las medidas de Conservación y Ordenación, la reunión de preparación de datos de rabil (3 documentos), la reunión intersesiones del Grupo de especies de tiburones (4 documentos), la reunión de evaluación de los stocks de atún blanco del Atlántico sur y norte, la reunión de evaluación del stock de rabil (2 documentos) y la reunión del Subcomité de ecosistemas. Se continuó con el trabajo de control en puerto de buques de tercera bandera iniciado durante 2009. Se realizaron inspecciones en puerto para determinar cuáles son las especies desembarcadas, cuál es su origen y controlando aspectos formales de la documentación de los barcos. Todas las Recomendaciones de la CICAA aprobadas durante la Reunión de la Comisión en el año 2016 han sido internalizadas en Uruguay, y actualmente rigen bajo decreto.

#### - Cooperating Non-Contracting Parties, Entities and Fishing Entities

#### Chinese Taipei

In 2016, the number of authorized fishing vessels was 101 with 70 targeting bigeye tuna and 31 targeting albacore, and the total catch of tuna and tuna-like species was about 30,517 t. Bigeye tuna was the most dominant species, which accounts for 43% of the total catch in weight, followed by albacore with catch accounting for 39% of the total catch. We have carried out a scientific observer program for the tuna fishery in ICCAT waters since 2002. In 2016, there were 19 observers deployed on fishing vessels operating in the Atlantic Ocean, and the observer coverage on albacore and bigeye vessels was 6.63% and 11.79% respectively. The research programs conducted by scientists in 2016-2017 included the researches on CPUE standardizations and assessments of bigeye tuna, yellowfin tuna, albacore, swordfish and sharks; the impact of climatic change on major tuna stocks; studies of shark by-catch and abundance index; the age and growth of sharks; and the research on incidental catch of ecological related species. The research results were presented at the inter-sessional working group meetings and regular meetings of SCRS. As for the reporting obligation, the related statistical information and information required by ICCAT Recommendations was submitted to the ICCAT Secretariat within the required timeframe.

#### 8. Executive Summaries on species

The Committee reiterated that in order to achieve a more rigorous understanding of these Executive Summaries from a scientific point of view, the previous Executive Summaries should be consulted, as well as the corresponding Detailed Reports which are published in the *Collective Volume of Scientific Papers*.

The Committee also pointed out that the texts and tables of these Summaries generally reflect the information available in ICCAT immediately prior to the SCRS plenary sessions, since they were prepared during the meetings of the Species Groups. Therefore, the catches reported to ICCAT during or after the SCRS meeting cannot be included in these Summaries.

#### 8.1 YFT - YELLOWFIN TUNA

A stock assessment for yellowfin tuna was conducted in 2016, at which time catch and effort data through 2014 were available. The catch table presented in this Executive Summary (**YFT-Table 1**) has been updated to include reported catches through 2016, including revisions to Ghanaian catches for the period 1973-2014 that have been incorporated since the last assessment. The revisions to Ghanaian yellowfin tuna catches for 2015 and 2016 are still pending review by the SCRS. Readers interested in a more complete summary of the state of knowledge on yellowfin tuna stock status should consult the detailed report of the 2016 ICCAT Yellowfin Tuna Stock Assessment Session (SCRS/2016/207). The Tropical Tunas Work Plan (SCI\_053, **Appendix 12**) includes plans to address research and assessment needs for yellowfin tuna.

#### YFT-1. Biology

Yellowfin tuna is a cosmopolitan species distributed mainly in the tropical and subtropical oceanic waters of the three oceans. The exploited sizes typically range from 30 cm to 170 cm FL. Juvenile yellowfin tuna form mixed schools with skipjack and juvenile bigeye, and are mainly limited to surface waters, while larger fish form schools in surface and sub-surface waters. Spawning on the main fishing grounds, the equatorial zone of the Gulf of Guinea, occurs primarily from December to April. Spawning also takes place in the Gulf of Mexico, the southeastern Caribbean Sea and off Cabo Verde, although the peak spawning can occur in different months in these regions. The relative importance of the various spawning grounds is unknown.

Although the distinct spawning areas might imply separate stocks, or substantial heterogeneity in the distribution of yellowfin tuna, a single stock for the entire Atlantic is currently assumed. This assumption is based upon information such as observed transatlantic movements (from west to east) indicated by conventional tagging and longline catch data that indicates yellowfin are distributed continuously throughout the tropical Atlantic Ocean. However, movement rates and timing, routes, and local residence times remain highly uncertain. In addition, some electronic tagging studies in the Atlantic as well as in other oceans suggest that there may be some degree of extended local residence times and/or site fidelity.

A recent study in the eastern Atlantic Ocean further described the reproductive traits of female yellowfin tuna including, sex-ratio, size at maturity, spawning seasonality, fish condition and fecundity. Size at 50% maturity was estimated at 103.9 cm fork length when cortical alveoli were used as a maturity threshold, however a larger size of around 120 cm at 50% maturity was estimated when more advanced oocytes were used. The conclusions of this research were incorporated in the 2016 stock assessment of yellowfin tuna.

Tagging studies of yellowfin in the Pacific and Indian Oceans suggest that natural mortality is age-specific, and higher for juveniles than for adults. Nevertheless, uncertainties remain as to the exact parameterization of the age-specific natural mortality function. As was applied for the recent bigeye tuna assessment, an age-specific natural mortality function (e.g. Lorenzen) was developed and applied to the 2016 assessment of yellowfin tuna. The most recent stock assessment does not consider sex-specific natural mortality or growth, yet there are disparities in average size by gender. Males are predominant in the catches of larger sized fish (over 145 cm), which could result if large females experience a higher natural mortality rate, perhaps as a consequence of spawning. In contrast, females are predominant in the catches of intermediate sizes (120 to 135 cm), which could result from differential growth (e.g. females having a lower asymptotic size than males). Recent results from studies in the Indian Ocean suggest a combination of the two hypotheses.

It is generally agreed that growth rates are relatively slow initially, increasing at the time the fish leave the nursery grounds. This interpretation is supported by analyses of size frequency distributions as well as tagging data. Regardless, questions remain concerning the most appropriate growth model for Atlantic yellowfin tuna, as analyses of hard part growth increments support somewhat different growth patterns.

Younger age classes of yellowfin tuna (40-80 cm) exhibit a strong association with FADs (natural or artificial fish aggregating devices/floating objects). The Committee noted that this association with FADs, which increases the vulnerability of these smaller fish to surface fishing gears, may also have an impact on the biology and on the ecology of yellowfin due to changes in feeding and migratory behaviors. These uncertainties in stock structure, natural mortality, and growth could have important implications for the stock assessment. The ongoing Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP), if fully successful, will help reduce these uncertainties.

#### YFT-2. Fishery indicators

Yellowfin tuna have been exploited by three major gears (longline, baitboat and purse seine fisheries) and by many countries throughout its range. Detailed data are available since the 1950s (**YFT-Table 1**). Overall Atlantic catches declined by nearly half from the peak in 1990 (193,600 t) to 109,000 t estimated for 2015, but have since increased to 127,800 t in 2016. The most recent catch distribution is given in **YFT-Figure 1**. However, it should be noted that official reports are not yet available from several Contracting and/or non-Contracting Parties, and that **YFT-Table 1** and **YFT-Figure 1** incorporate provisional scientific estimates of Ghanaian catches for 2006-2014.

In the eastern Atlantic, purse seine catches declined by over 60% between 1990 and 2007 (127,700 t to 48,000 t), but subsequently increased to 94,000 t in 2016 (**YFT-Table 1; YFT-Figure 2**). Baitboat catches declined by 70% between 1990 and 2015 (from 19,600 t to 5,900 t), but increased to 9,750 t in 2016. Longline catches, which were 10,300 t in 1990, declined to 4,860 t in 2016. In the western Atlantic, purse seine catches (predominantly from Venezuela) were as high as 25,700 t during the mid-1980s, but have since declined nearly 80% to 5,330 t in 2016. Baitboat catches also declined 80% since a peak in 1994 (7,100 t), and for 2016 were estimated to be about 1,150 t. Since 1990, longline catches have generally fluctuated between 10,000 t and 20,000 t.

The decline in purse seine catches during 1992-2007 was in large part due to a decline in the number of European and associated fleet purse seine vessels operating in the eastern Atlantic (e.g. from 67 vessels in 1992 to 27 vessels in 2007; **SKJ-Figure 9**). However, since that time, the number of purse seiners and overall fleet efficiency has increased as newer vessels with greater fishing power and carrying capacity have moved from the Indian Ocean to the Atlantic. The Committee notes that since 2013, six new purse seine vessels began operations in the Atlantic Ocean. By 2010, overall carrying capacity of the purse seine fleet had increased significantly, to about the same level as in the 1990s, and has increased by nearly 50% since. FAD based fishing has accelerated even more rapidly than free school fishing.

The Committee noted that surface fisheries for tropical tunas in the eastern Atlantic have expanded in recent years. Since 2011, significant catches of yellowfin tuna have been obtained by EU purse seiners south of 15°S off the coast of West Africa (in association with skipjack and bigeye on FADs). Another recent change is the implementation in 2012 of the strategy of fishing on floating objects off of Mauritania (north of 15°N). Catches on floating objects in this area tended to consist almost entirely of skipjack. Effort directed in this manner may therefore have a reduced impact on yellowfin tuna.

Catch-at-size was fully rebuilt for the assessment (1960-2014) to incorporate all new and revised size, and catch at size information available to ICCAT; note that samples from 1960-1965 were very limited. New and revised information were received from major purse seine and longline fleets, and from fisheries such as *"faux poisson"*. The species composition and catch at size of tropical tunas landed by Ghanaian baitboats and purse seiners were also updated for the period 2006-2014. These changes are reflected in **YFT-Table 1**. As in previous assessments, catch at age was estimated by slicing from deterministic growth functions.

Eight longline indices were selected for use in the stock assessment based on meeting specific criteria for inclusion. Indices with similar characteristic were grouped together using a cluster analysis. The two "clusters" represent unique hypotheses regarding trends in abundance of yellowfin tuna. Cluster 1 indices showed an initial decline, with nearly constant relative abundance since 1990, while Cluster 2 indices suggest increased abundance during the 1990s, followed by a general decline through 2014 **(YFT-Figure 3)**. The two trends represent a major source of scientific uncertainty regarding the abundance of yellowfin tuna. Several nominal baitboat and purse seine indices which had been used in previous assessments were eliminated from the 2016 assessment because they had not been standardized, lacked documentation, or their diagnostic characteristics could not be examined. Abundance indices from surface fleets, particularly those that capture newly recruited fish could be useful if properly adjusted for changes in fishing power. Future work to develop, document and maintain indices from these fleets is desirable.

New information was recently made available (SCRS/2017/206) regarding the standardized catch rates of yellowfin tuna from the South African pole-and-line fishery during 2003-2016. The analyses indicate that the CPUE of the South African baitboat fishery for yellowfin tuna exhibits high inter-annual variability but, overall, has maintained similar levels to those from the previous decade. A decrease in CPUE from 2006-2009 was noted and could not be explained by targeting, weather or effort shifts. With additional evaluation, indices from this region could be considered for use in future stock assessments, especially if the spatial structure of the stock can be better accommodated.

The average weight trends by fleet (1970-2014) are shown in **YFT-Figure 4**. The recent average weight in European purse seine catches, which represent the majority of the landings, had declined to about half of the average weight of 1990. This decline is at least in part due to changes in selectivity associated with fishing on floating objects beginning in the 1990s, which was observed in the increased catches of small yellowfin. A declining trend in average weight and a corresponding increase in the catch of small yellowfin is also evident in eastern tropical baitboat catches. Longline mean weights and catch at size have been more variable.

## YFT-3. State of the stock

A full stock assessment was conducted for vellowfin tuna in 2016, applying three age-structured models and a non-equilibrium production model to the available catch data through 2014. As has been done in previous stock assessments, stock status was evaluated using both surplus production and age-structured models. Models used to develop management advice considered two primary sources of scientific uncertainty, the use of index clusters that reflect two disparate hypotheses regarding trends in abundance of yellowfin tuna, and alternative model structures as implemented using four model platforms. Surplus production models that used Cluster 2 indices did not converge and were not considered. Management advice was developed using a joint distribution of the results of seven models (ASPIC Cluster 1; ASPM-Clusters 1 and 2, VPA Clusters 1 and 2, SS Clusters 1 and 2) which were weighted equally. Additional uncertainties in growth, age-slicing, mortality, index selection and data weighting were explored in sensitivity runs. Trends in biomass (YFT-Figure 5) and fishing mortality (YFT-Figure 6), relative to the levels that produce MSY, were generally similar for all models used to develop management advice, although small differences in current stock status were noted (YFT-Figures 5 and 6). Model specific Kobe status plots (YFT-Figure 7), with the annual trajectories of stock status, indicate that for most models the 2014 stock status was near B<sub>MSY</sub> and below F<sub>MSY</sub>. Annual trajectories should be interpreted with caution because they are not adjusted for known changes in selectivity.

The estimated MSY (median = 126,304 t) may be below what was achieved in past decades because overall selectivity has shifted to smaller fish. The impact of this change in selectivity on estimates of MSY is clearly seen in the results from age structured models (e.g. **YFT-Figure 8**). Bootstrapped estimates of the current status for the seven models, which reflect the variability of the point estimates given assumptions about uncertainty in the inputs, are shown in **YFT-Figure 9**. When the uncertainty around the point estimates from all models is taken into account, there was an estimated 45.5% chance that the stock was healthy (not overfished and overfishing not occurring) in 2014, a 41.2% probability that the stock was overfished, but not experiencing overfishing, and a 13.3% chance that the stock was both overfished and undergoing overfishing (**YFT-Figure 10**).

In summary, 2014 stock biomass was estimated to be about 5% below  $B_{MSY}$  (overfished) and fishing mortality rates were about 23% below  $F_{MSY}$  (no overfishing).

## YFT-4. Outlook

Projections conducted in 2016 considered a number of constant catch scenarios (**YFT-Figures 11-12**). In most cases, catches less than 120,000 t led to, or maintained a healthy stock status through 2024. The results from the seven models were summarized to produce estimated probabilities of achieving the Convention objectives ( $B > B_{MSY}$ ,  $F < F_{MSY}$ ), for a given level of constant catch, for each year up to 2024 (**YFT-Table 2**). Maintaining catch levels at the current TAC of 110,000 t was expected to maintain healthy stock status ( $B > B_{MSY}$ ,  $F < F_{MSY}$ ) through 2024 with at least 68% probability, increasing to 97% by 2024. As the actual 2016 catches exceeded the values assumed for projections and the TAC, the percentages above (and in **YFT-Table 2**), are likely to be optimistic.

## YFT-5. Effect of current regulations

Closures in various time-areas in the eastern tropical Atlantic have been in place during some prior years, imposing restrictions on either FAD-associated sets or all surface gears. Recommendation 11-01 (later Rec. 14-01) implemented a closure of surface fishing on FADs in the area from the African coast to 10°S, 5°W-5°E during January-February in the Gulf of Guinea. This closure came into effect in 2013. The efficacy of the area-time closure (moratorium) agreed in Rec. 14-01 was evaluated by examining fine-scale (1°x1°) skipjack, yellowfin, and bigeye catch by month distributions from the European and associated purse seine

fleet FAD fishery and the Ghanaian purse seine and baitboat fishery. After reviewing this information, the Committee concluded that the moratorium had not been effective at reducing the mortality of juvenile bigeye tuna, and any reduction in yellowfin tuna mortality was minimal, largely due to the redistribution of effort into areas adjacent to the moratorium area. The anticipated effect of the moratorium described in Rec. 16-01 will be evaluated when data becomes available.

Rec. 14-01 (reiterated in 16-01) also implemented a TAC of 110,000 t for 2012 and subsequent years. The overall catches in 2012 (104,500 t), 2013 (97,300 t), 2014 (97,000 t) and 2015 (108,900 t) were lower than this TAC, but the 2016 estimates exceeded the TAC (127,800 t).

#### YFT-6. Management recommendations

Based on the 2016 stock assessment, the Atlantic yellowfin tuna stock was estimated to be overfished, but at 95%  $B_{MSY}$  in 2014. Maintaining catch levels at the current TAC of 110,000 t was expected to maintain healthy stock status through 2024. However, 2016 catches exceeded the catch recommendation by 16%.

The Commission should also be aware that increased harvests on FADs could have negative consequences for yellowfin and bigeye tuna, as well as other by-catch species<sup>\*</sup>. Should the Commission wish to increase long term sustainable yield, the Committee continues to recommend that effective measures be found to reduce FAD-related and other fishing mortality of small yellowfin tuna.

<sup>\*</sup> Second Meeting of the Ad Hoc Working Group on FADs (Bilbao, Spain, 14-16 March 2016) (SCRS/2016/003).

# ATLANTIC YELLOWFIN TUNA SUMMARY

Maximum Sustainable Yield (MSY) 2016 Yield

Relative Biomass B2014/ BMSY Relative Fishing Mortality: F<sub>current (2014)</sub>/F<sub>MSY</sub> 2014 Total Biomass 126,304 t (119,100 - 151,255 t)<sup>1</sup> 127,800 t

0.95 (0.71-1.36)<sup>1</sup> 0.77 (0.53-1.05)<sup>1</sup> 464,712 t (308,287 – 731,485 t)<sup>1</sup>

Stock Status (2014)

Overfished: Yes Overfishing: No

Management measures in effect:

[Rec. 14-01]:

- Time-area closure for FAD associated surface fishing
- TAC of 110,000 t
- Specific authorization to fish for tropical tunas for vessels 20 meters or greater
- Specific limits of number of longline and/or purse seine boats for a number of fleets

[Rec. 16-01]

- Revised time-area closure for FAD associated surface fishing
- TAC of 110,000 t
- Specific authorization to fish for tropical tunas for vessels 20 meters or greater
- Specific limits of number of longline and/or purse seine boats for a number of fleets
- Specific limits on FADs, non-entangling FADs required

**NOTE:**  $F_{current(2014)}$  refers to  $F_{2014}$  in the case of ASPIC, ASPM and SS, and the geometric mean of F across 2011-2013 in the case of VPA. Relative biomass is calculated in terms of spawning stock biomass in the case of ASPM, SS and VPA and in total biomass in the case of ASPIC.

<sup>1</sup> Median (10<sup>th</sup>-90<sup>th</sup> percentiles) from joint distribution of age-structured and production model bootstrap outcomes considered.

The Brazilian catches for 2016 are SCRS estimations (carry over based on a 2013-2015 average) obtained due to the absence of official statistics.

Les prises brésiliennes au titre de 2016 sont des estimations du SCRS (report fondé sur la moyenne de 2013-2015) en raison de l'absence de statistiques officielles.

Las capturas brasileñas para 2016 son estimaciones del SCRS (traspaso basado en una media de 2013-2015) obtenidas debido a la falta de estadísticas oficiales.

**YFT-Table 2.** Kobe II matrices giving the probability that  $F < F_{MSY}$ ,  $B > B_{MSY}$  and the joint probability of  $F < F_{MSY}$  and  $B > B_{MSY}$ , in given years, for various constant catch levels based on combined model results.

## a) Probability that F<F<sub>MSY</sub>

Note: SS, VPA and ASPIC projections applied an assumed catch of 110,337 (2015 estimate with carry-overs) to 2015 and 2016, prior to the application of the constant TACs of 60,000 to 150,000 t in 2017-2024. Due to a software constraint, ASPM projections applied constant TACs beginning in 2015.

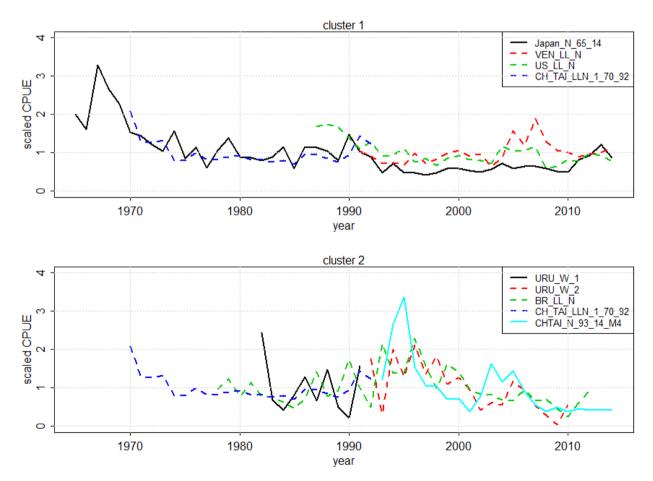

e. YFT (FAD/FREE 1991-2015)

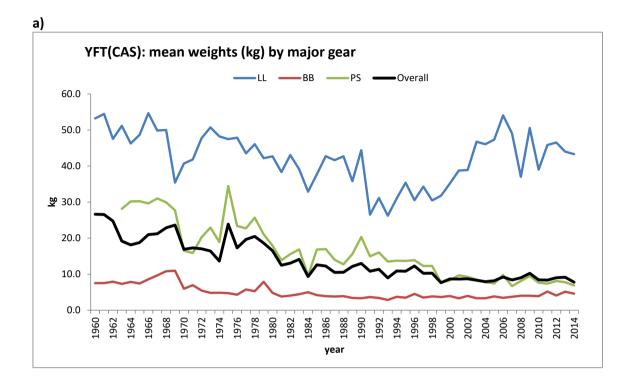

**YFT-Figure 1.** Geographical distribution of yellowfin tuna total catches by major gears [a-e] and by decade [f-k]. The maps are scaled to the maximum catch observed during 1960-2015. Note: the last panel (k) shows only 6 years of information. Thus, apparent changes in the size of the pie charts (in k) should not be interpreted as a reduction in catch during 2010-2015.

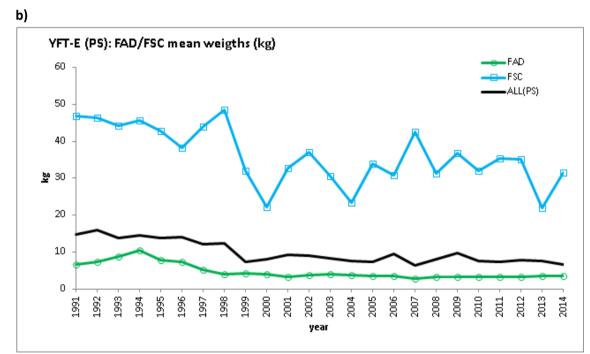

**YFT-Figure 2.** Estimated annual catch (t) of Atlantic yellowfin tuna by fishing gear, 1950-2016. A TAC of 110,000 t has been in place since 2012 [Rec. 14-01].

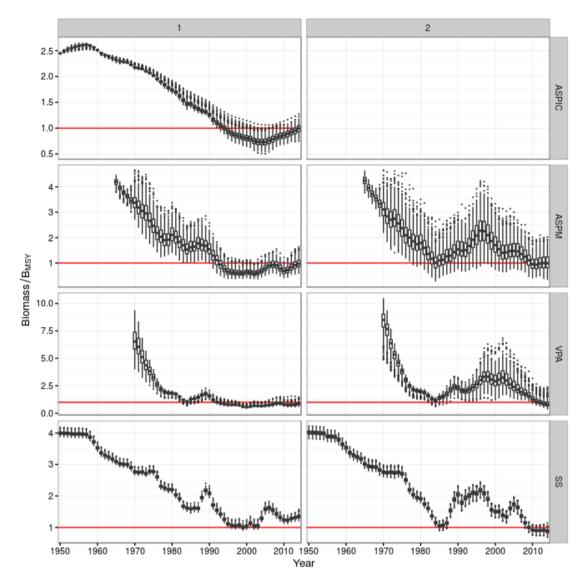

**YFT-Figure 3.** Yellowfin standardized catch rate trends from cluster 1 (top panel) and cluster 2 (bottom panel) indices of abundance.

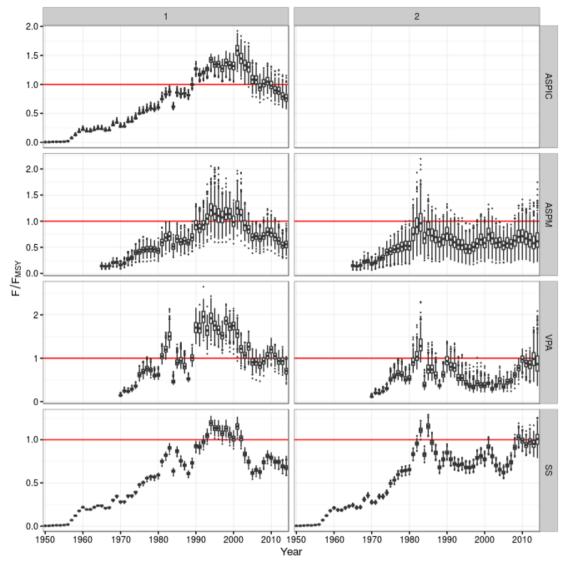

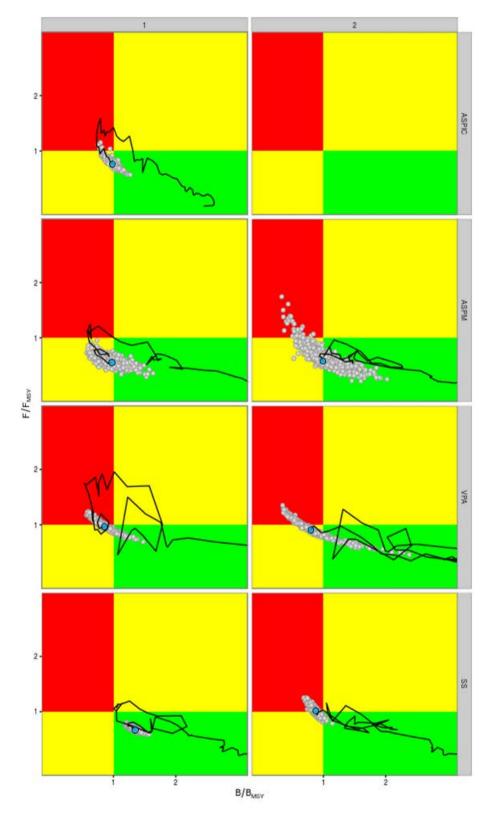

**YFT-Figure 4.** Trends in estimated mean weight (kg, weighted by respective catches) of yellowfin tuna: a) Overall, by major gear (1960-2014); b) Only eastern purse seine fishery (1991-2014), by operation mode (FSC: free schools; FAD: associated schools). Note: The mean weight of the baitboat fishery (panel a) reflects various baitboat fleets operating in different areas of the Atlantic Ocean.

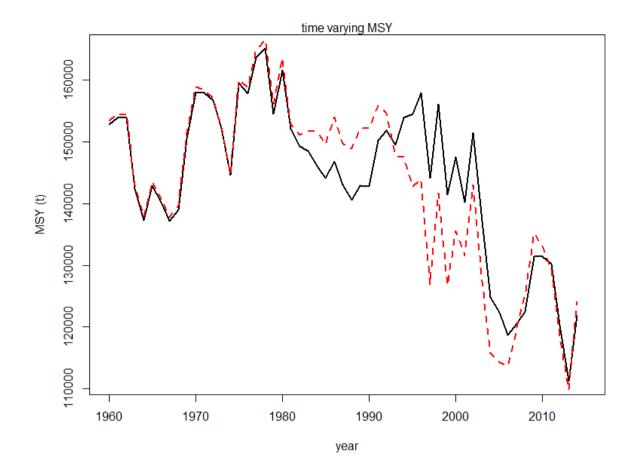

**YFT-Figure 5.** Trends in biomass relative to the level that produces MSY (red) for the model runs used to develop management advice. Box and whisker plots indicate the uncertainty in bootstrap estimates. (Boxes indicate the annual median estimates, 25<sup>th</sup> and 75<sup>th</sup> percentiles; whiskers and points indicate the range of more extreme outcomes).

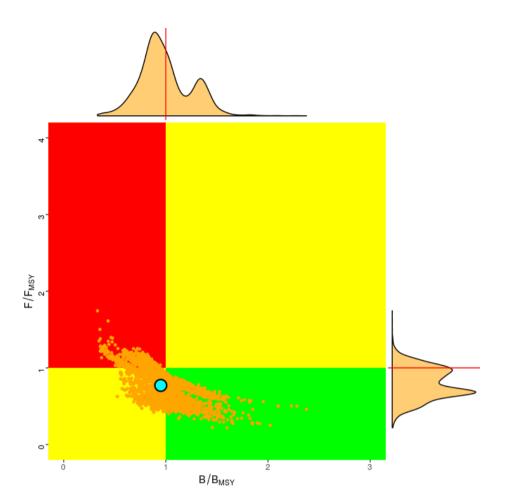

**YFT-Figure 6.** Trends in fishing mortality relative to the level that produces MSY (red) for the model runs used to develop management advice. Box and whisker plots indicate the uncertainty in bootstrap estimates. (Boxes indicate the annual median estimates, 25<sup>th</sup> and 75<sup>th</sup> percentiles; whiskers and points indicate the range of more extreme outcomes).

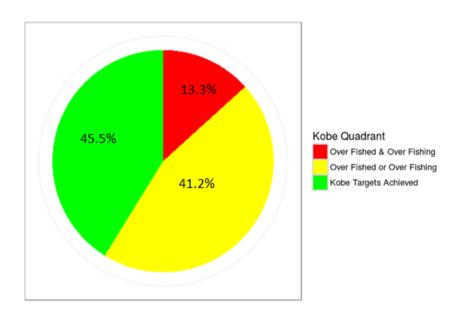

**YFT-Figure 7.** Kobe Status Plot for each model with 500 bootstrap estimates of the uncertainty in current stock status. The trajectories are intended to demonstrate general trends in stock status, but do not account for known changes in selectivity.

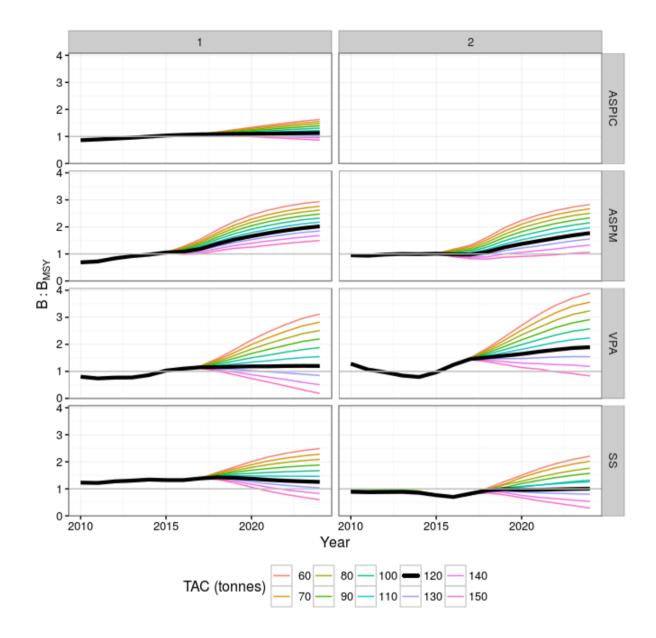

**YFT-Figure 8.** MSY estimated annually from an age structured stock assessment (SS) using cluster 1 and 2 indices.

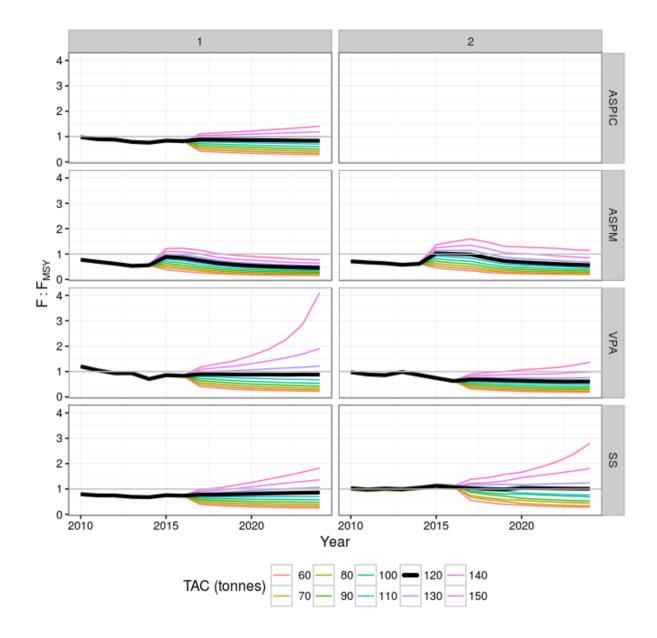

**YFT-Figure 9.** Kobe Phase Plot and marginal density for all models (used to develop management advice) combined.

**YFT-Figure 10.** Summary of current status estimates for the yellowfin tuna stock based on age structured and production models making use of the catch and effort data through 2014.

**YFT-Figure 11.** Median B/B<sub>MSY</sub> (2010 – 2024) for projections of constant TACs of 60,000 to 150,000 t . SS, VPA and ASPIC projections applied an assumed catch of 110,337 (2015 estimate with carry-overs) to 2015 and 2016, prior to the application of the constant TACs of 60,000 to 150,000 t in 2017-2024. Due to a software constraint, ASPM projections applied constant TACs beginning in 2015.

**YFT-Figure 12.** Median F/F<sub>MSY</sub> (2010 – 2024) for projections of constant TACs of 60,000 to 150,000 t. SS, VPA and ASPIC projections applied an assumed catch of 110,337 (2015 estimate with carry-overs) to 2015 and 2016, prior to the application of the constant TACs of 60,000 to 150,000 t in 2017-2024. Due to a software constraint, ASPM projections applied constant TACs beginning in 2015.

#### 8.2 BET - BIGEYE TUNA

The last stock assessment for bigeye tuna was conducted in 2015 (Anon., 2016) through a process that included a data preparatory meeting in May and an assessment meeting in July. The stock assessment used fishery data from the period 1950-2014 and most indices of relative abundance used in the assessment were also constructed through 2014. This executive summary reports the most up to date fishery indicators for bigeye available in 2017 to update bigeye management advice.

# BET-1. Biology

Bigeve tuna are distributed throughout the Atlantic Ocean between 50°N and 45°S, but not in the Mediterranean Sea. This species swims at deeper depths than other tropical tuna species and exhibits extensive vertical movements. Similar to the results obtained in other oceans, pop-up tagging and sonic tracking studies conducted on adult fish in the Atlantic have revealed that they exhibit clear diurnal patterns: they are found much deeper during the daytime than at night. In the eastern tropical Pacific, this diurnal pattern is exhibited equally by juveniles and adults. In the western Pacific these daily patterns have been associated with feeding and are synchronized with depth changes in the deep scattering layer. Spawning takes place in tropical waters when the environment is favorable. From nursery areas in tropical waters, juvenile fish tend to diffuse into temperate waters as they grow. Catch information from surface gears indicate that the Gulf of Guinea is a major nursery ground for this species. Dietary habits of bigeye tuna are varied and prey organisms like fish, mollusks, and crustaceans are found in their stomach contents. Bigeye tuna exhibit relatively fast growth: about 105 cm fork length at age three, 140 cm at age five and 163 cm at age seven. Recently, however, reports from other oceans suggest that growth rates of juvenile bigeye are lower than those estimated in the Atlantic. Bigeye tuna over 200 cm are relatively rare. The growth rates of bigeye tuna by sex are different based on Indian Ocean tagging data, males reaching around 10 cm larger Linf than females. Bigeye tuna become mature around 100 cm at between 3 and 4 years old. Young fish form schools mixed with other tunas such as yellowfin tuna and skipjack. These schools are often associated with drifting objects, whale sharks and sea mounts. This association weakens as bigeye tuna grow. Indian and Pacific Oceans tagging data showed that bigeye longevity is over 10 years, which may imply lower natural mortality rates than previously being assumed for the Atlantic Ocean. Therefore, the Committee has adopted a new natural mortality vector for the last assessment done in 2015 which is considered to more appropriately reflect this. Various pieces of evidence, such as a lack of identified genetic heterogeneity, the time-area distribution of fish and movements of tagged fish, suggest an Atlantic-wide single stock for this species, which is currently accepted by the Committee. However, the possibility of other scenarios, such as north and south stocks, should not be disregarded. These uncertainties in stock structure, natural mortality, and growth could have important implications for the stock assessment. The ongoing Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP), if fully successful, will help reduce these uncertainties.

#### BET-2. Fisheries indicators

The stock has been exploited by three major gears (longline, baitboat and purse seine fisheries) and by many countries throughout its range and ICCAT has detailed data on the fishery for this stock since the 1950s. Scientific sampling at landing ports for purse seine vessels from the EU and associated fleets has been conducted since 1980 to estimate bigeye tuna catches (**BET-Figure 1, BET-Table 1**). The size of fish caught varies among fisheries: medium to large fish for the longline fishery, small to large for the directed baitboat fishery, and small for other baitboat and for purse seine fisheries.

The major baitboat fisheries are located in Ghana, Senegal, the Canary Islands, Madeira and the Azores. The tropical purse seine fleets operate in the Gulf of Guinea in the East Atlantic. In the eastern Atlantic, these fleets are comprised of vessels flying the flags of Ghana, EU-France, EU-Spain and others which are mostly managed by EU companies. The longline fleets operated across a broader geographic range, covering tropical and temperate regions (**BET-Figure 1**). While bigeye tuna is now a primary target species for most of the longline and some baitboat fisheries, this species has always been of secondary importance for the other surface fisheries. In the purse seine fishery, unlike yellowfin tuna, bigeye tuna are mostly caught while fishing on floating objects such as logs or manmade fish aggregating devices (FADs). The estimated total numbers of FADs released yearly has increased since the beginning of the FAD fishery, especially in recent years. During 2012-2016, landings of bigeye in weight caught by longline fleets represent 47%, while purse seine fleets represent 37% and baitboat and other surface fleets represent 15% of the total (**BET-Table 1**).

In 2016, however, landing of bigeye in weight caught by longline represent 49%, while purse seiner and baitboat fleets represent 39% and 10%, respectively.

The total annual Task I catch (**BET-Table 1**, **BET-Figure 2**) increased up to the mid-1970s reaching 60,000 t and fluctuated over the next 15 years. In 1992, catch reached 100,000 t and continued to increase, reaching an historic high of about 135,000 t in 1994. Since then, reported and estimated catch continuously declined and fell to 58,875 t 2006. From 2006 catches have increased and fluctuated between around 75,000 t and 80,000 t, with the exception of 2008 (67,720 t). The preliminary catch estimated for 2016 is 72,375 t, a reduction of 9% from 2015 levels (79,861 t).

After the historic high catch in 1994, all major fisheries exhibited a decline in catch while the relative share by each fishery in total catch remained relatively constant until 2008. These reductions in catch were related to declines in fishing fleet size (longline) as well as decline in CPUE (longline and baitboat). Although the general trend of decreasing catches continued for longline and baitboat, the purse seiner catches increased, as did the relative contribution of purse seine in the total catches in the period 2010-2016. The number of active purse seiners declined by more than half from 1994 until 2006, but then increased as some vessels returned from the Indian Ocean to the Atlantic (**SKJ-Figure 9**) and since 2014, the number of purse seine vessels has remained stable. While the number of purse seiners operating in 2010-2014 was stable purse seine carrying capacity during the same period showed an increasing trend.

Species composition and catch at size from the Ghanaian fleet of baitboats and purse seiners, has been thoroughly reviewed during the past few years. This review has led to new estimates of Task I, and partially Task II catch and effort and size, for these fleets for the period 1973-2013. This revision has shown that catches of bigeye tuna by Ghanaian fleets over the period 1996-2005 were significantly lower than previously estimated by an average of 2,500 t but larger for the period 2006-2013. Although the Committee agreed to use the new estimates for 2006-2013, and carry over of 2013 estimate to 2014 for the assessment, after the stock assessment meeting, some issues with the area stratification used to estimate the species composition of recent Ghanaian catches were identified; which implies that the most recent Ghanaian catches (from 2012 to 2014) could be underestimated by 25% (2012) and 45% (2013 and 2014). Thus, estimates for 2012-2014 are considered provisional and should be reviewed in the future. No new information on Ghana statistics was presented in the Intersessional Working Group on Tropical tunas in 2017.

Significant catches of small bigeye tuna continue to be channeled to local West African markets, predominantly in Abidjan, and sold as "*faux poisson*" in ways that make their monitoring and official reporting challenging. Monitoring of such catches has recently progressed through a coordinated approach that allows ICCAT to properly account for these catches and thus increase the quality of the basic catch and size data available for assessments. Currently those catches are included for the main purse seine fleet in the ICCAT Task I data used for the assessment up to 2014. No update estimates of *faux poisson* are available for the 2015-2016 period.

Mean average weight of bigeye tuna decreased prior to 1993 but has remained relatively stable at around 10 kg for the last decade (**BET-Figure 3**). This mean weight, however, is quite different for the different fishing gears in recent years, around 62 kg for longliners, around an average of 18 kg for baitboats (with different mean weight for different fleet segments: 9 kg for Dakar baitboat and 3 kg for Tema baitboat), and 4 kg for purse seiners. In the last ten years, several longline fleets have shown increases in the mean weight of bigeye tuna caught, with the average longline-caught fish increasing from 40 kg to 60 kg between 1999 and 2008. During the same period, purse seine-caught bigeye tuna had average weights between 3 kg and 4 kg. Average weight of bigeye tuna caught in free schools is more than twice the average weight of those caught around FADs. Since 1991, when bigeye catches were identified separately for FADs for EU and associated purse seine fleets, the majority of bigeye tuna are caught in sets associated with FADs (75%-80%). Similarly baitboat-caught bigeye tuna weighted between 6 and 10 kg up to 2011, but with greater inter-annual variability in average weight compared to longline or purse seine caught fish, while it increased to around 18 kg since 2012.

A number of standardized indices of abundance were developed by national scientists for selected fleets for which data were available at greater spatial and/or temporal resolution for the assessment. These indices represented data from five different fleets, four longline fleets and one baitboat fleet which were used in different stock assessment methods (**BET-Figure 4**). New information was recently made available (SCRS/2017/204) regarding the standardized catch rates of bigeye tuna from the South African longline fishery during 2004-2016. The analyses indicate that the CPUE of the South African longline fishery for bigeye tuna exhibits larger inter-annual variability and no clear trend. A revised standardization of bigeye for the Japanese longline fishery in the main Atlantic fishing ground for the period 1961–2016 in response to recommendations from the Bigeye Data Preparatory Meeting (2015) to solve over-parameterization, improve spatial resolution of catches and incorporate SST data was presented (SCRS/2017/195). With the exception of the early period (1960s), the results were similar to those derived from the previous method. It was noted that since the last assessment (2015) bigeye CPUE has remained stable.

# BET-3. State of the stock

Stock status evaluations for Atlantic bigeye tuna used several modeling approaches, ranging from nonequilibrium production models to integrated statistical assessment models. The results of different model formulations considered to be plausible representations of the stock dynamics were used to characterize stock status and the uncertainties in the status evaluations. The 2015 stock assessment was conducted using similar assessment models to those used in 2010 but with updated data and relative abundance indices.

In 2010, the stock status determination and management advice was based on the results obtained with non-equilibrium production models. Virtual population analysis results were used to characterize the uncertainty in stock status as related to model structure. Integrated statistical models were also run in 2010 and those results were used to explore the gains obtained by integrating more data sources (e.g. length composition data) as well as to take into account different exploitation patterns and selectivities of different type of gears.

In 2015, results from a non-equilibrium production model and an integrated statistical assessment model, which can account for temporal changes in selectivity, were used to provide the status of the resource. Multiple runs of each model were included in the results, using alternative assumptions in order to better reflect the uncertainties in the assessment. The non-equilibrium production model results included 3 different runs, which used different individual CPUE indices. These CPUEs were based on longline indices that characterize the adult component of the stock, while the production model dynamics are based on exploitable biomass. The integrated statistical assessment model results included 12 different runs, reflecting different assumptions regarding growth, the influence of spawning biomass on recruitment, and confidence in available size data. Because the results of both non-equilibrium production model and integrated assessment model were considered to represent plausible alternative hypotheses of stock status, they were given equal weight in determining the state of the stock.

In 2015, a non-equilibrium production model was run using the composite index from 2010 and a new composite index generated in 2015 (using a similar procedure as in 2010). The objective was to compare the robustness of the assessment and projection conducted in 2010 with the assessment done in 2015. The results of 2010 assessment were projected until 2014 using the reported catches. The exercise showed that stock status for 2010, when re-estimated in 2015, was more pessimistic than originally estimated during the 2010 assessment. In general, data availability has continued to improve. There are still missing data within the ICCAT database on detailed catch statistics, catch and effort and fish size from some important fleets for which estimation of catches were available. All these issues forced the Committee to estimate the catch of some important fleets as well as assume catch-at-size for an important part of the overall catch which contribute to the overall uncertainty in the assessment results. Final modifications to these inputs were performed during the assessment meeting, such as an update of the total catch of Ghanaian fleet for the period 2006-2013, catch for 2014, and the identification of representative CPUE indices for stock assessment.

Various CPUE indices (**BET-Figure 4**) were used for non-equilibrium production model and integrated statistical assessment model. For the non-equilibrium production model, the Committee considered that it is more appropriate to use multiple indices in separate runs, as different hypotheses of stock dynamics, rather than including potentially conflicting indices in a single run or combined as a single index. This is different from the approach taken in the 2010 stock assessment. In the 2010 assessment, a single combined CPUE index, which is a combination of various CPUE indices available at that time, was used for various non-equilibrium production model runs.

The stock biomass estimated from the three non-equilibrium production model runs declines from the beginning of the time series in the 1950s (**BET-Figure 5**). The decline in biomass corresponds with increasing fishing mortality including a sharp increase of fishing mortality and catch in the 1990s and a peak of fishing mortality by the end of the 1990s. From the late 1990s, the biomass and fishing mortality trajectories of the 3 scenarios were different. While biomass increased and fishing mortality decreased in one of the runs using the Chinese Taipei CPUE; biomass continued to decrease at a lower rate in the other runs and fishing mortality showed a general increasing trend in one run (except for the last three years when F decreased) and was somewhat stable in the last run. The three runs show similar trajectories of the 1990s, but 2 out of 3 runs estimate that on average the stock still remains in the red area since 2000; while the third estimates a recovery towards the green area since the mid-2000s (**BET-Figure 6**). The results based on the three scenarios suggest that the stocks status in recent years varied between scenarios (B<sub>2014</sub>/B<sub>MSY</sub> ratio is from 0.554 to 1.225 and F<sub>2014</sub>/F<sub>MSY</sub> ratio is from 0.576 to 1.436 (**BET-Figure 7**).

The SS3 model results indicate that fishing mortality increased steadily since the beginning of the fishery, rapidly increased by the end of the 1990s, fluctuating around the level corresponding to  $F_{MSY}$  in the 2000s, then increased sharply at the end of the 2000s where F>F<sub>MSY</sub> in 2011, and decreased in the latest three years. However, it remained at levels higher than  $F_{MSY}$  in 7 out of 12 scenarios in 2014 (**BET-Figure 8**). With regards to biomass, it decreased constantly since the beginning of the time series and fell below and remained below B<sub>MSY</sub> levels since 2010. It should be noted that those F<sub>MSY</sub> and B<sub>MSY</sub> trajectories (**BET-Figure 8**) was estimated using 2014 selectivity pattern without accounting for selectivity changes over time. The results based on the twelve cases studied suggest that the stocks status in recent years varied between cases (B<sub>2014</sub>/B<sub>MSY</sub> ratio is from 0.435 to 0.917 and F<sub>2014</sub>/F<sub>MSY</sub> ratio is from 0.776 to 1.635 (**BET-Figure 9a**). In the combined phase plot of equally weighted 12 SS3 scenarios, taking into account the uncertainty around the point estimates from all scenarios, there was an estimated 67% chance that the stock is being overfished and overfishing is occurring in 2014 (**BET-Figure 9b**).

The current MSY may be below what was achieved in past decades because overall selectivity has shifted to smaller fish; the impact of this change in selectivity on estimates of MSY is clearly seen in the results from integrated statistical assessment models (**BET-Figure 10**). While the potential MSY has decreased over time the spawning stock biomass required to produce this MSY has increased.

Most of the integrated statistical assessment model runs give a similar view compared to the nonequilibrium production model runs regarding the historical evolution of the relative patterns in biomass and fishing mortality. Both assessment models suggest that biomass decreased throughout the period investigated, with the exception of one run of the non-equilibrium production model where a recovery is observed since 2005. For fishing mortality, both assessment models show that F increased sharply by the late 1990s, then fluctuated to reach a similar level of the late 1990s in 2004/2005 and increased again in 2011 to decrease the last three years. **BET-Figure 11** shows a combined Kobe phase plot of both assessment models, which formulates the basis of the management recommendation. The combined plot was developed by giving equal weighting between non-equilibrium production model and integrated statistical assessment model results. Within each model type equal weighting was given to each run. There was an estimated 70% chance that the stock was being overfished and overfishing was occurring in 2014.

The incorporation of the revised catch estimates for Ghana, as well as additional reporting and corrections, has resulted in a somewhat different catch history from what was available for the last assessment in 2010. The projections done in 2010, which provide a characterization of the prospects of the stock achieving or being maintained at levels consistent with the Convention objective, over time, showed that the probabilities of the stock being maintained at levels capable of producing MSY by 2015 were about 60% for a future constant catch set of the TAC level of 85,000 t at that time. As stated in 2010, any changes in the exploitation pattern and selectivity due to changes in the ratios of relative mortality exerted by the different fleets – such as an increase in the relative mortality of small fish – during the projected period would have affected and changed the outcomes of those projections. Although catches from the period 2012 to 2014

were lower than the adopted TAC the status of the stock worsened. The proportion of small age 0 and 1 bigeye has shown a continuous increase since the beginning of the time series which may have affected the prospect of recovery of the population and worsened the status of the stock in 2015. The relative contribution of purse seine gear to the total catch has increased by 50% in the period 2009-2014 from the period 2000-2008.

The Committee notes, as it did in previous assessments, that there is considerable uncertainty as well as potential bias in the assessment of stock status and productivity for bigeye tuna. There are many sources of uncertainty including which method represents best the dynamics of the stock, which method is supported more by the available data, which relative abundance indices are appropriate to be used in the assessment, and what precision is associated with the measurement/calculation of each of the model inputs. In general, data availability has improved since 2010 but there is still a lack of information regarding detailed fishing effort and catch-at-size data from certain fleets.

# BET-4. Outlook

It was noted in 2015 that the modeled probabilities of the stock achieving levels consistent with the Convention objective at the end of the projected time period in 2028 was 29% for a future constant catch at the TAC level of 85,000 t established in Rec. 14-01, and 41% probability at catch levels of 70,000 t. Higher probabilities of rebuilding require longer timeframes and/or larger reduction of current catches. For instance, 49% probability of rebuilding would be achieved by 2028 with a constant catch of 65,000 t and 58% of probability with catches of 60,000 t, (**BET-Table 2**).

It needs to be noted that projections made by the Committee assume that future constant catches represent the total removals from the stock, and not just the reported catches and the current selectivity pattern is maintained. ICCAT established a TAC of 85,000 t for 2010 onwards (Rec. 09-01, Rec. 11-01 and Rec. 14-01) and reduced the TAC to 65,000 t for 2016 onwards (Rec. 15-01 and Rec. 16-01). Note that because this TAC does not affect all countries that can catch bigeye tuna, in theory the total catch removed from the stock could exceed the TAC which will worsen the prospect of stock rebuilding. Furthermore, any future changes in selectivity due to changes in the ratios of relative mortality exerted by the different fleets – such as an increase in the relative mortality of small fish – will change and add to the uncertainty of these projections.

#### BET-5. Effect of current regulations

During the period 2005-2008 an overall TAC was set at 90,000 t. The TAC was later lowered (Rec. 09-01 and later modified by Rec. 14-01) to 85,000 t. Estimates of reported catch for 2009-2015 (**BET-Table 1**) have been always lower than 85,000 t. The TAC was again reduced to 65,000 t in Recommendation 15-01 which enters into force in 2016. Projections indicated that catches at the current TAC level (65,000 t) would have 49% chances of achieving Convention objectives by 2028. This probability may be improved by the additional measures (i.e. FAD moratorium) agreed by the Commission. However, 2016 catches (72,375 t) exceeded the TAC of 65,000 t by 11%. Therefore, if future catches are maintained at the level of 2016, the probability of achieving Convention objectives by 2028 ( $B > B_{MSY}$ ,  $F < F_{MSY}$ ) is expected to decrease to around 38 % (**BET-Table 2**).

Concern over the catch of small bigeye tuna partially led to the establishment of spatial closures to surface fishing gear in the Gulf of Guinea (Recs. 04-01, 08-01, 11-01, 14-01, 15-01). The Committee examined trends in average bigeye tuna catches by areas as a broad indicator of the effects of such closures as well as changes in juvenile bigeye and yellowfin catches due to the moratorium. The efficacy of the area-time closure (moratorium) agreed in Rec. 14-01 was evaluated by examining fine-scale (1°x1°) skipjack, yellowfin, and bigeye catch by month distributions from the European and associated purse seine fleet FAD fishery and the Ghanaian purse seine and baitboat fishery. After reviewing this information, the Committee concluded that the moratorium has not been effective at reducing the mortality of juvenile bigeye tuna, and any reduction in yellowfin tuna mortality was minimal, largely due to the redistribution of effort into areas adjacent to the moratorium area. The efficacy of the area-time closure agreed in Rec. 15-01 has not been evaluated; however, purse seiner catches in 2016 have not decreased from 2014-2015 levels.

#### BET-6. Management recommendations

The Atlantic bigeye tuna stock was estimated to be overfished and that overfishing was occurring in 2014. Projections indicated that maintaining catch levels at the current TAC of 65,000 t was expected to recover the stock status to Convention objectives with 49% probability by 2028. However, 2016 catches (72,375 t) exceeded the TAC of 65,000 t by 11%. Therefore, if future catches are maintained at the level of 2016, the probability of achieving Convention objectives by 2028 (B>B<sub>MSY</sub>, F<F<sub>MSY</sub>) is expected to decrease to around 38 % (**BET-Table 2**).

The Commission should be aware that increased harvests on FADs could have had negative consequences for the productivity of bigeye tuna fisheries (e.g. reduced yield at MSY and increased SSB required to produce MSY) and, therefore, should the Commission wish to increase long-term sustainable yield, the Committee continues to recommend that effective measures be found to reduce FAD-related and other fishing mortality of small bigeye tunas. However, the Commission should be aware that increased harvests on FADs could have negative consequences for yellowfin and bigeye tuna, as well as other by-catch species<sup>\*</sup>.

ATLANTIC BIO	GEYE TUNA SUMMARY
Maximum Sustainable Yield	78,824 t (67,725-85,009 t) <sup>1</sup>
Current (2016) Yield	72,375 t <sup>2</sup>
Relative Biomass (B2014/BMSY)	0.67 (0.48-1.20) <sup>1</sup>
Relative Fishing Mortality (F2014/FMSY) Stock Status (2014)	1.28 (0.62-1.85) <sup>1</sup> Overfished: Yes
	Overfishing: Yes
Conservation & management measures in effect:	<ul> <li>[Rec. 16-01]</li> <li>Total allowable catch for 2016-2018 is set at 65,000 t for Contracting Parties and Cooperating non-Contracting Parties, Entities or Fishing Entities.</li> <li>Be restricted to the number of their vessels notified to ICCAT in 2005 as fishing for bigeye tuna.</li> <li>Specific limits of number of longline boats; China (65), Chinese Taipei (75), Philippines (5), Korea (14), EU (269) and Japan (231).</li> <li>Specific limits of number of purse seine boats; EU (34) and Ghana (17).</li> <li>No fishing with natural or artificial floating objects during January and February in the area encompassed by the African coast, 20° W, 5°N and 4°S.</li> <li>No more than 500 FADs active at any time by vessel.</li> <li>Use of non-entangling FADs.</li> </ul>

<sup>1</sup> Combined results of non-equilibrium production model and statistical integrated assessment models. Median and 10 and 90% percentile in brackets.

<sup>2</sup> Reports for 2016 reflect most recent data but should be considered provisional.

<sup>\*</sup> Second Meeting of the Ad Hoc Working Group on FADs (*Bilbao, Spain, 14-16 March 2016*) (SCRS/2016/003).

**BET-Figure 2.** Bigeye estimated and reported catches for all the Atlantic stock (t). The value for 2016 represents preliminary estimates because some countries have yet to provide data for this year or are under revision.

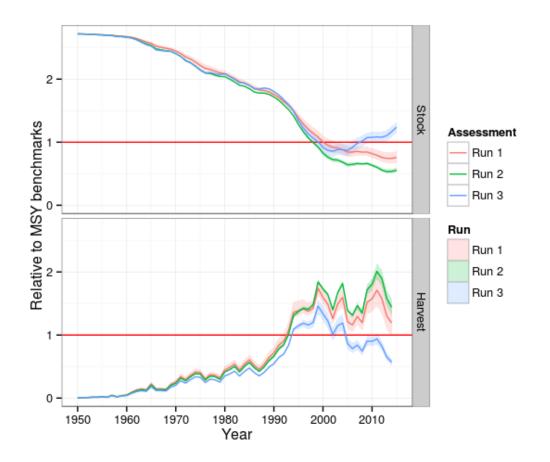

**BET-Figure 3.** Trend of mean weight for bigeye based on the catch-at-size data for 1975-<u>2014</u> by major fisheries (BB=Baitboats, LL=Longlines, PS=Purse seine). The mean weight of the baitboat fishery (BB) reflects various baitboat fleets operating in different areas of the Atlantic Ocean.

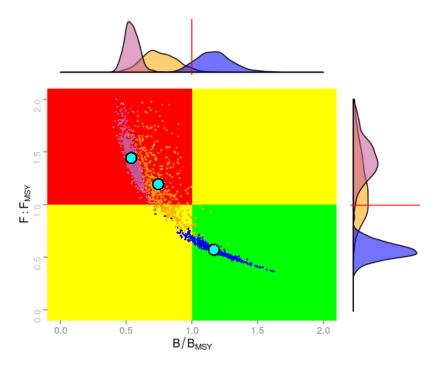

**BET-Figure 4.** (a) Indices used in the integrated statistical assessment model. Note that these are the annual means but the indices were calculated by area and season for input into the model. (b) Indices used in the non-equilibrium production assessment model.

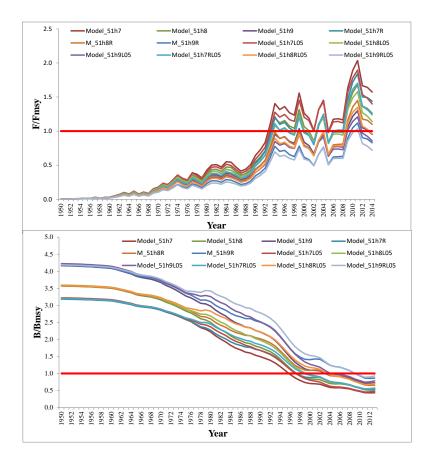

**BET-Figure 5.** Trajectories of biomass, fishing mortality and yield from different ASPIC scenarios. Run 1: using USA LL CPUE; Run 2: using Japanese LL CPUE; and Run 3: using Chinese Taipei LL CPUE.

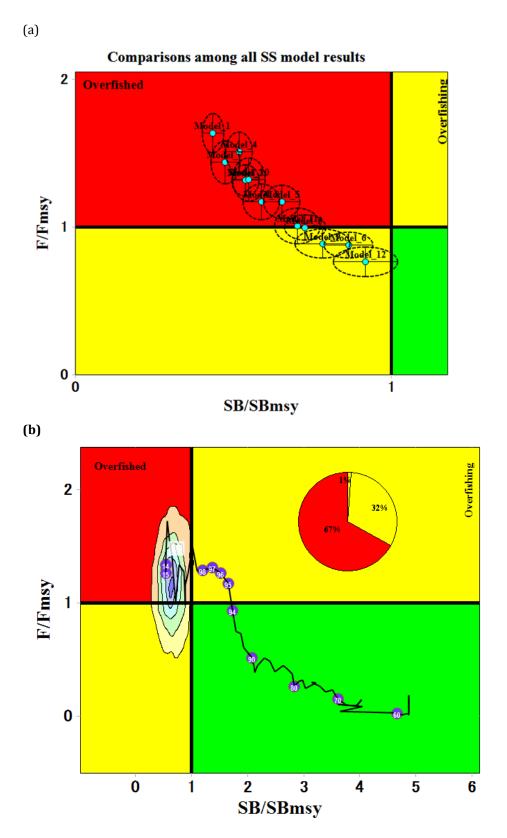

**BET-Figure 6.** Trajectories of  $B/B_{MSY}$  and  $F/F_{MSY}$  estimated from the different runs of ASPIC. Lines represent the medians and ribbons the inter-quantiles. Run 1: using USA LL CPUE; Run 2: using Japanese LL CPUE; and Run 3: using Chinese Taipei LL CPUE.

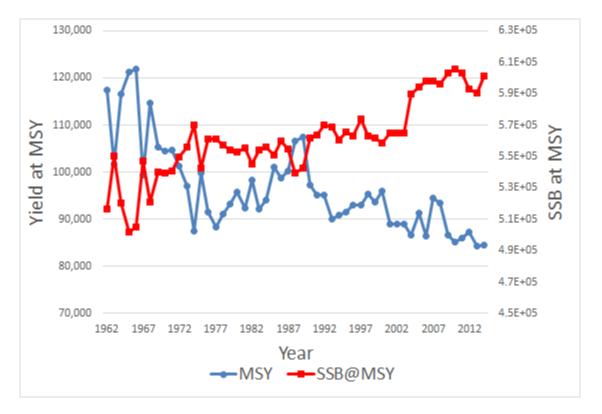

**BET-Figure 7.** ASPIC: Current status (2014) of bigeye tuna based on ASPIC. Graph combines results for the 3 runs considered. The clouds of points depict the bootstrap estimates of uncertainty for the most recent year (purple = Japan LL run, brown = US LL run, blue= Chinese Taipei LL run). The median point estimate for each model's results are shown in open (cyan) circles. The marginal density plots shown above and to the right of the main graph reflect the frequency distribution of the bootstrap estimates of each model with respect to relative biomass (top) and relative fishing mortality (right). The red lines represent the benchmark levels (ratios equal to 1.0).

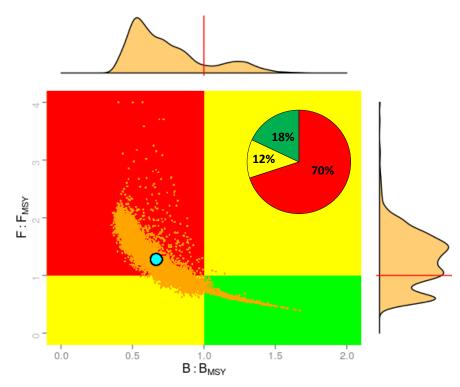

**BET-Figure 8.** Estimated Spawning Stock Biomass and fishing mortality relative to MSY benchmark ( $B/B_{MSY}$  and  $F/F_{MSY}$ ) both based on 2014 selectivity patterns for the 12 SS3 selected runs.

**BET-Figure 9.** Kobe Phase Plot for SS3: (A) for all runs separately and (b) combined 2014 status outcomes – the trajectory shown is an illustrative example which accounts for changes in selectivity over time of run 8.

**BET-Figure 10.** Year/selectivity specific maximum sustainable yield (MSY) and spawning stock biomass (SSB) required to produce that maximum sustainable yield.

**BET-Figure 11.** Combined Kobe phase plot of non-equilibrium production model and integrated stock assessment model. The combined plot was developed by giving equal weighting between production models and integrated assessment model results. Within each model type equal weighting was given to different runs.

### 8.3 SKJ – SKIPJACK TUNA

Stock assessments for East and West Atlantic skipjack were conducted in 2014 using catch data available to 2013. The previous assessment of skipjack stocks was only conducted in 2008. This report is an update of that of 2016 covering the most recent information on the state of the stocks on this species.

### SKJ-1. Biology

Skipjack tuna is a gregarious species that is found in schools in the tropical and subtropical waters of the three oceans (**SKJ-Figure 1a and b**). Skipjack is the predominant species aggregated to FADs where it is caught in association with juvenile yellowfin tuna, bigeye tuna and with other species of epipelagic fauna. Skipjack reproductive potential is considered to be high because it reaches sexual maturity around one year and it spawns opportunistically in warm waters above 25°C throughout the year and in large areas of the ocean. Moreover, the analysis of East Atlantic tagging data has confirmed that the growth of skipjack was quicker in sub-tropical waters than in equatorial waters where it produces most of its spawn. These growth differences depending on latitude must be taken into account if the assessments are carried out on separate stocks between sub-tropical and tropical areas. It is also possible that the growth does not follow the conventional Von Bertalanffy model but rather a two-stanza model. The appropriate growth model may be confirmed before the next skipjack stock assessment by using the tag data from the AOTTP. Based on the relationships between life history characteristics and natural mortality, a natural mortality vector decreasing with size has been estimated (SKJ-Figure 2). The natural mortality values estimated by this approach are greater than those used in the past for East Atlantic skipjack. Lower values have been obtained by another approach which has been applied for the western stock, whose catches are however composed of larger sized individuals than in the eastern stock.

The increasing use of fish aggregation devices (FADs) since the early 1990s, have changed the species composition of free schools. It is noted that, in fact, the free schools of mixed species were considerably more common prior to the introduction of FADs. Furthermore, the association with FADs may also have an impact on the biology (growth rate, plumpness of the fish) and on the ecology (distances, movement orientation) of skipjack and yellowfin ("ecological trap" concept).

#### SKJ-2. Fishery indicators

Following the historic record in 2013 (255,730 t), the total catches of skipjack throughout the Atlantic Ocean (including catches of "*faux poisson*" landed in Côte d'Ivoire) remain high, reaching 245,933 t in 2016 (**SKJ-Table 1, SKJ-Figure 3**). This represents a very sharp rise compared to the average catches of the five years prior to 2010 (155,157 t). It is possible, however, that the catches of a segment of the Ghanaian purse seine fleet, transshipped on carriers, have escaped the fishery statistics collection process before 2011. In addition, following the expert missions carried out in Ghana which have shown the existence of bias in the sampling protocol which aims to correct the multi-species compositions of the catches reported in the logbooks, Ghanaian Task I and II statistics have been reviewed in several stages (1973-2005). The review for the period 2006-2014 had shown that the skipjack catches reported by Ghana were underestimated by around 28%, which gives an average of 12,000 t/year. Therefore, all of these historical data have consequently been corrected.

The numerous changes that have occurred in the skipjack fishery since the early 1990s (e.g. the progressive use of FADs and the latitudinal expansion and the westward extension of the fishing area) have brought about an increase in skipjack catchability and in the proportion of biomass exploited. Currently, the major fisheries are the purse seine fisheries, particularly those of Belize, Curaçao, EU-France, EU-Spain, Ghana, Guinea, Panama, and Cabo Verde, followed by the baitboat fisheries of EU-Portugal, EU-Spain, Ghana, and Senegal. The preliminary estimates of catches made in 2016 in the East Atlantic amounted to 217,363 t, which is an increase of about 68% as compared to the average of 2005-2009 (SKJ-Figure 4). It should be noted that there has been a sharp increase in the skipjack catches by the European purse seiners, probably due to the high selling price of this species from 2011 to mid-2013 (SKJ-Figure 5). This increase in catches is accompanied by changes in fishing strategies since the proportion of skipjack catches using floating objects has continued to increase. This is the result to some extent of the sharp reduction in seasonal fishing by European purse seiners on free schools after 2006 off the coast of Senegal and of the emergence as from 2012 of atypical fishing off FADs since it involves single species schools composed of large individuals off the coast of Mauritania (**SKI-Figure 1B**). These changes in fishing strategy can take place differently in the purse seine fleets, including in fleets that operated similarly in the past (SKJ-Figure 6) and are therefore difficult to integrate into stock assessment models.

The unreported catches of some purse seiners were estimated by comparing the monitored landings in West African ports and cannery data to the catches reported to ICCAT. Estimates of the unreported catches of these purse seiners have increased since 2006 and may have exceeded 20,000 t for the three main species of tropical tunas. The Committee expressed the need for the countries and the industry concerned in the region to cooperate to estimate and report these catches accurately to ICCAT. Recent progress in the transmission and review of data submitted to the ICCAT Secretariat has enabled the Committee to partially include these catches and the associated sizes in the skipjack assessment. The magnitudes of these estimates of IUU catch, however, are likely to influence the assessments and the perception of stock status.

The average rate of discards of skipjack on FADs by European purse seiners operating in the eastern Atlantic has been estimated based on onboard observer programmes to be 42 kg per t of skipjack landed. Furthermore, the amount of small skipjack (average size 37 cm FL) landed in the local market of Abidjan in Côte d'Ivoire as "*faux poisson*" has been estimated at 235 kg per t of skipjack landed (i.e. an average of 6,641 t/year between 1988 and 2007 for the European or associated purse seiners, **SKJ-Figure 7**). However, the latest estimates indicate values close to 10,000 t/year between 2005 and 2014 for all purse seiners operating in the eastern Atlantic (skipjack representing around 30% of the total "*faux poisson*": the species composition in 2014 has not been taken into account because it seems less accurate than in previous years). The Committee regularly incorporates these estimates into the reported historical catches for the EU purse seiners since 1982, as well as in the catch-at-size matrix. "*Faux poisson*" estimates for 2015 and 2016 are not yet available. The Group needs additional information on modification to the access rights to fishing grounds along the African coast to be able to assess catch trends.

In the West Atlantic the major fishery is the Brazilian baitboat fishery, followed by the Venezuelan purse seine fleet. The preliminary estimates of catches in 2016 made in the West Atlantic amounted to 28,570 t (against the historic record of 40,272 t in 1985 (**SKJ-Figure 8**).

It is difficult to discriminate a fishing effort between free schools (composed of large vellowfin tunas) and for FAD fishing (targeting skipjack) in the East Atlantic because the fishing strategies can change from one year to the next and in addition, the sea time devoted to activities on FADs and the assistance provided by supply vessels are difficult to quantify. The Committee recognizes that the use of data series on the yearly progression of the sale prices of tropical species by commercial category enables identification of the years when skipjack is most targeted by the purse seiners (which seems to be the case in the past few years, **SKJ**-Figure 6). Nominal purse seine effort, expressed in terms of carrying capacity, has decreased regularly since the mid-1990s up to 2006. However, after this date, several European Union purse seiners have transferred their effort to the East Atlantic, due to piracy in the Indian Ocean, and a fleet of new purse seiners have started operating from Tema (Ghana), whose catches are probably underestimated. All this has contributed to the growth in carrying capacity of the purse seiners, which is gradually nearing the level observed in the early 1990s (SKJ-Figure 9). The number of purse seiners follows this trend but seems to have remained steady since 2010; the nominal effort of baitboats has remained stable for over 20 years. By 2010, overall carrying capacity of the purse seine fleet had increased significantly, to about the same level as in the 1990s, and has increased by nearly 50% since. FAD based fishing has accelerated even more rapidly than free school fishing.

It is recognised that the increase in fishing power linked to the introduction of technological innovation on board the vessels as well as to the development of fishing using floating objects has resulted in an increase in the efficiency of the various fleets, since the early 1980s. In order to take into account the effect of the technological changes in skipjack catchability, an annual yearly growth of 3% is generally assumed as the working hypothesis, although an analysis carried out fixing the MSY and K at the values estimated in the previous stock assessment would suggest an increase in catchability between 1 and 13% per year. Moreover, the estimates on growth in bigeye catchability, whose juveniles are also captured using FADs, would indeed indicate a value of 2.5% per year before 1991 and 6 to 8% thereafter. However, it is not known whether these estimates only reflect technological changes, or the availability of fish as well, resulting from the expansion of the surface area exploited over the years, reaching its historic high in 2013 and which corresponds to the expansion of the fishery towards the West Central Atlantic or more recently to the level of the North and South latitudes (**SKJ-Figure 10**).

The increase in total mortality (Z) between the early 1980s and the late 1990s, estimated using different methods, such as the tag-recovery model, the catch curves by size and the average size observed in the yearly catches, is consistent with an increase in catchability. The steady decrease in average weight up to 2011 (**SKJ-Figure 11**) is also consistent with the fact that the purse seine fleet has increased pressure on juvenile tunas. This trend has reversed since 2012 and at the same time a broadening of the range of sizes caught is observed (**SKJ-Figure 12**). Generally, except the East Pacific, it has been noted that the average skipjack weight observed in the East Atlantic (close to 2 kg) was much lower than the estimates provided for the other oceans (close to 3 kg).

With respect to the West Atlantic, the fishing effort of the Brazilian baitboats, which constitute the main skipjack fishery in this region, seems to have stabilised over the past 20 years. No marked trend regarding the structure of catches by size has been observed (**SKJ-Figure 13**).

### SKJ-3. State of the stocks

In all the oceans, the traditional stock assessment models are difficult to apply to skipjack because of their particular biological and fishery characteristics (on the one hand, continuous spawning, spatial variation in growth and on the other, discrimination of effort for free schools and FADs, transition between these two fishing methods which are difficult to quantify). In order to overcome these difficulties, several assessment methods, conventional and non-conventional (based solely on catches, or on development of average size) have been applied to the two stocks of Atlantic skipjack. Several fishery indicators have also been analysed in order to track the development of the state of the stock over time.

Based on the large geographic distances between the fishing areas and current knowledge on small-scale migrations of skipjack in the Atlantic (**SKJ-Figure 1a and b** and **SKJ-Figure 14**), the Committee has also analysed the possibility of using smaller stock units. While recognising the validity of this approach, the Committee does not currently have evidence, such as a sufficient amount of tag-recovery data covering the entire tropical ocean, in order to validate smaller stock units. Consequently, the Committee has decided to maintain the working hypothesis which favours two different units of eastern and western stocks but on an experimental basis to assess a sub-unit in each of the two stocks. The use of smaller areas has however been recommended to monitor the development over time of fishery indicators. It is expected that the five year Atlantic Tropical Tuna Tagging Programme (AOTTP), may improve our understanding of skipjack stock structures and movement patterns.

#### Eastern stock

The Committee has analysed two standardized fishery indices from the EU-purse seine fishery: an index which accounts for skipjack caught in free schools off the coast of Senegal up to 2006 and the second index which characterises fish captured off FADs and in free schools in the equatorial area (**SKJ-Figure 15**). The increase in CPUE of the European purse seiners in the late 1990s is partly the consequence of the increase in the catches of positive sets under FADS, in particular for Spanish vessels since 2011 (**SKJ-Figure 16**). In addition, the introduction of the price of skipjack (price adjusted for inflation) into the standardisation of the CPUE has not improved the fit. Furthermore, the regular increase in the skipjack yields of the baitboats based in Senegal may only be the result of an increase in catchability linked to the adoption of the so-called "baitboat associated school" fishing towards the mid-1980s (**SKJ Figure 15**). No marked trend has been observed for the Canary Islands baitboats, nor for the peripheral fishery of the Azorean baitboat fishery. Although the Committee has only considered a single stock for the East Atlantic, due to the very low apparent exchange rates between the sectors (based on available information, only 0.9% of tagged fish on both sides of the latitude 10°N have exceeded this limit), a decrease in abundance for a local segment of the stock would probably have little repercussion on abundance in other areas (refer to notion of stock viscosity).

Regardless of the model used: 2 surplus biomass production models (one non-equilibrium conventional model, and one Bayesian model), a model based only on catch and a mortality estimation model based on the average sizes of fish captured, the Committee was not in a position to provide a reliable estimate of the maximum sustainable yield and therefore nor provide advice on the state of the eastern stock. This applies in the Bayesian case, (1) after testing different working hypotheses on the a priori distribution of the input parameters of the surplus production model (i.e. the growth rate and the carrying capacity), and on the impact of the growth of the catchability coefficient on the CPUE of each fleet, and (2) after performing a

retrospective analysis in the case of the catch-only based model. The absence of definition of a fishing effort associated with FADs for the purse seiners, the difficulty of taking into account changes in catchability, the lack of marked contrast in the datasets despite the historical development of the fishing pressure (**SKJ-Figure 9**) and the fact that the catches and the CPUEs have increased in parallel in recent years are constraints for effective use of the classic stock assessment methods. The Committee has also highlighted that it is difficult to estimate the MSY in conditions of continuous growth of catches without having reliable indicators on the response of the stock to these increases. These indicators may be improved CPUE series, fishing mortality estimates from tagging programmes or other indicators on the exploitation of this species.

Even if caution must be exercised when formulating a diagnosis on the state of the stock in the absence of quantification by an adequate approach, there is no evidence of a fall in yield, or in the average weight of individuals captured (**SKJ-Figure 11**). The estimated value of the MSY, according to the catch-only assessment model, has tended to increase in recent years but at a growth rate that is lower than that observed for the catches for the same period. However, according to this model, although it is unlikely that the eastern skipjack stock is overexploited, current catches could be at, even above, the MSY.

As in the past, it is difficult to know whether this hypothesis can be applied to all spatial components of this stock in the East Atlantic, due to the moderate exchange rates which seem to exist between the different sectors of this region. The Committee considers that the MSY should be higher than that estimated in the 2008 assessment in a different exploitation plot to the current one, but cannot express an opinion on the level of the new MSY and the sustainability of the current catches, nor on the repercussions of this exploitation plot on juveniles of the two other species of tropical tunas.

Taking into account the biological and fishery specificities of skipjack, the Committee has attempted to develop Harvest Control Rules based on the proportion of individuals whose sizes are larger than the reference sizes (e.g. size at sexual maturity, the size corresponding to the length which maximises the catches for a given cohort, etc.). The Committee recommends, however, that due to the multi-species nature of the tropical tuna fishery, the HCRs on skipjack take into account the consequences of targeting skipjack on the other two species of tropical tunas.

# Western stock

The CPUEs in the West were those of the Brazilian baitboat which remain relatively stable, those of the Venezuelan purse seiner, the US pelagic longline and a larval index (**SKJ-Figure 17**). In addition, the average weight of skipjack caught in the West Atlantic is higher than in the East (3 to 4.5 kg compared to 2 to 2.5 kg), at least for the Brazilian baitboat fishery.

The model based on catches and the non-equilibrium surplus biomass production model have estimated respectively the MSY at 30,000 t - 32,000 t (which remains close to the previous estimates in the order of 34,000 t). The fishing mortality vector estimated by a method based on the development of average size of individuals captured over time (mainly from Brazilian catches) shows a profiles which is very close to that estimated by the non-equilibrium surplus biomass model (**SKJ-Figure 18**).

It should be emphasised that all these analyses rest on the assumption of a single western stock from the US coast to Brazil and correspond to the current geographic coverage of this fishery.

For the western Atlantic stock, in light of the information provided by the trajectory of B/B<sub>MSY</sub> and F/F<sub>MSY</sub> ratios (**SKJ-Figure 19**), it is unlikely that the current catch is larger than the replacement yield.

# SKJ-4. Effect of current regulations

There is currently no specific regulation in place for skipjack tuna. Several time/area regulatory measures on banning fishing on FADs [Rec. 98-01, Rec. 99-01, Rec. 14-01 and Rec. 16-01] or on complete closure to surface fleets [Rec. 04-01] have however been implemented in the East Atlantic but the intended aim was to protect yellowfin and bigeye tuna juveniles.

The new Recommendation [Rec. 16-01] establishes a moratorium on FAD fishing in the area that extends from to 4°S and 5°N latitude and from African coast to 20°W longitude during the months of January and February, entered into force in 2016.

#### SKJ-5. Management recommendations

Despite the absence of evidence that the eastern stock is overexploited, but considering (1) the lack of quantitative findings for the eastern stock assessment, and (2) pending the submission of additional data (including on FADs and on the ongoing AOTTP) which are necessary to improve the stock assessment, the Committee recommends that the catch and effort levels do not exceed the level of 2012-2013 catch or effort. In addition, the Commission should be aware that increasing harvests and fishing effort for skipjack could lead to involuntary consequences for other species that are caught in combination with skipjack in certain fisheries (particularly juveniles of yellowfin and bigeye<sup>\*</sup>). For the West Atlantic, the Committee recommends that the catches should not be allowed to exceed the MSY.

Despite recent progress, the Committee has expressed its concern regarding uncertainties which the underreporting of skipjack catches may have on the perception of the state of the stocks.

	ANTIC SKIPJACK SUMMARY TABLE	
	East Atlantic	West Atlantic
Maximum Sustainable Yield (MSY)	Probably higher than previous estimates (143,000-170,000 t)	Around 30,000-32,000 t
Current yield (2016 <sup>1</sup> )	217,363 t	28,570 t
Current Replacement Yield	Unknown	Somewhat below 32,000 t
Relative Biomass (B2013/BMSY)	Likely >1	Probably close to 1.3
Mortality due to fishing (F2013/FMSY)	Likely <1	Probably close to 0.7
Stock Status		
Overfished:	Not likely	Not
Overfishing:	Not likely	Not
Management measures in force	Rec. 16-01 <sup>2</sup>	None

<sup>1</sup>Reports of catches for 2016 should be considered provisional, particularly for the West Atlantic.

<sup>2</sup> This moratorium on FADs entered into force in June 2016 and replaces Rec. 15-01.

\* Second Meeting of the Ad Hoc Working Group on FADs (Bilbao, Spain, 14-16 March 2016) (SCRS/2016/003).

The Brazilian catches for 2016 are SCRS estimations (carry over based on a 2013-2015 average) obtained due to the absence of official statistics.

Les prises brésiliennes au titre de 2016 sont des estimations du SCRS (report fondé sur la moyenne de 2013-2015) en raison de l'absence de statistiques officielles.

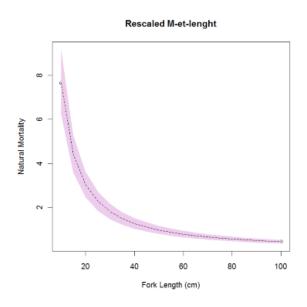

Las capturas brasileñas para 2016 son estimaciones del SCRS (traspaso basado en una media de 2013-2015) obtenidas debido a la falta de estadísticas oficiales.

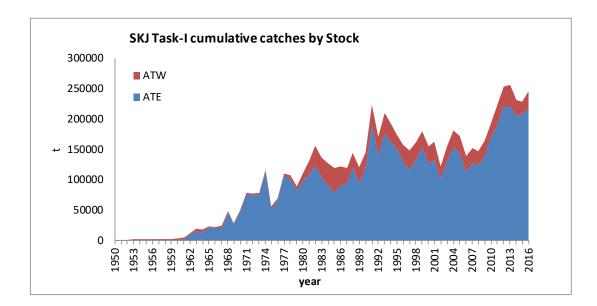

**SKJ-Figure 1A [a-f].** Geographical distribution of the skipjack catch by major gears and decade. The maps are scaled to the maximum catch observed during 1960-2015 (last decade only covers 6 years).

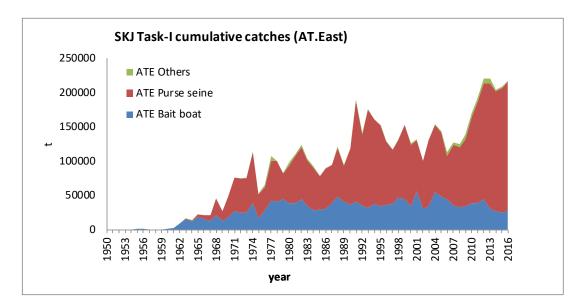

**SKJ-Figure 1B.** Distribution of skipjack catches in the Atlantic for baitboat (upper left panel) between 1950 and 2014 and for purse seiners (upper right panel) by fishing mode (free schools vs. FADs. UNK is considered to be mainly free schools in the Western and mainly FAD in the Eastern Atlantic) between 1991 and 2014. Skipjack catches made by European and associated purse seiners (about 75% of the total catches) between 2000 and 2006 (lower left panel) and between 2007 and 2014 (lower right panel) showing the withdrawal from the Senegal fishing zone on free schools, due to non-renewal of the fishing agreements in 2006, and the appearance of a fishing area under FADs in 2012 North of 15°N latitude.

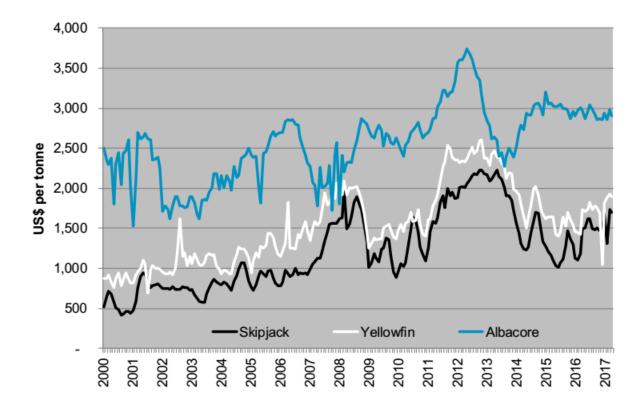

**SKJ-Figure 2.** Estimates of natural mortality by size of Atlantic skipjack calculated by empirical relationships between mortality and some biological parameters (which show different values from those traditionally used in the East.

**SKJ-Figure 3.** Total skipjack catches (t) in the Atlantic and by stock (East and West) between 1950 and 2016. Skipjack estimates in the *faux poissons* landed in Côte d'Ivoire were included in the skipjack trade catches in the eastern Atlantic except for 2016. It is possible that skipjack catches taken in the eastern Atlantic in recent years were not reported or were under-estimated in the logbook correction of species composition based on multi-species sampling carried out at the ports. The 2016 figure is still preliminary, in particular for the East Atlantic.

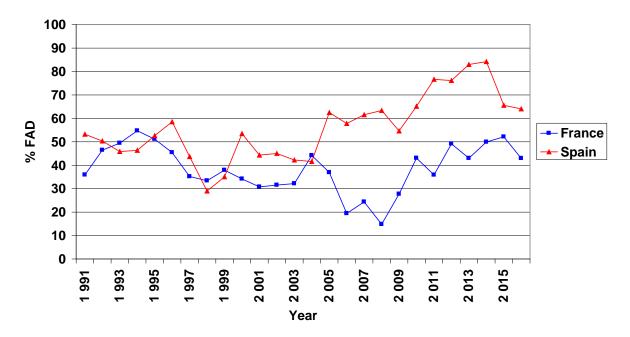

**SKJ-Figure 4.** Skipjack catches in the eastern Atlantic, by gear (1950-2016), after correction of Ghana's data by species (1996-2014).

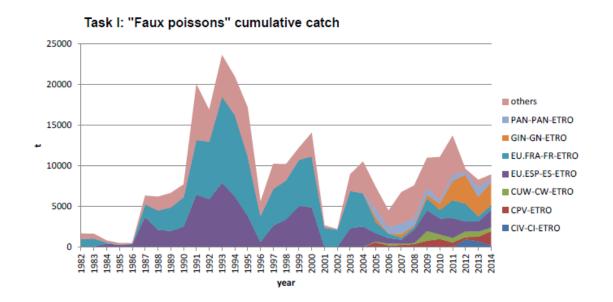

**SKJ-Figure 5.** Average prices of skipjack and yellowfin in U.S. dollars (adjusted for inflation and converted into the value of the 2015\$US) in the Bangkok market.

Atlantic Ocean; % of FAD catches by fleet

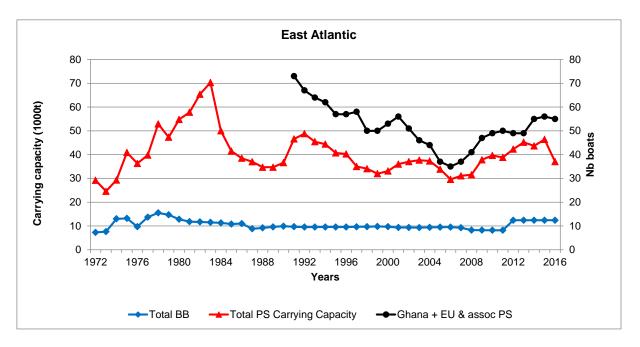

**SKJ-Figure 6.** Changes in the proportion of total catches under FADs made by French and Spanish purse seiners (1991-2016). The increase in the percentage of catches under FADs coincides with the shift from the Senegal area, known for its seasonal fishing on free schools (see **Figure 1**), and with the increase of skipjack prices.

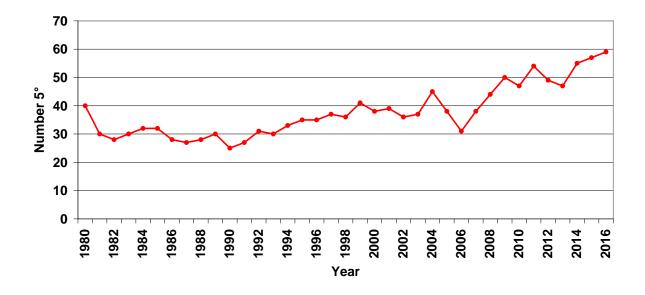

**SKJ-Figure 7.** Cumulative estimated landings of *faux poissons* (1981-2014) by purse seiners operating in the Eastern Atlantic for the three major species of tropical tunas in the local market of Abidjan (Côte d'Ivoire).

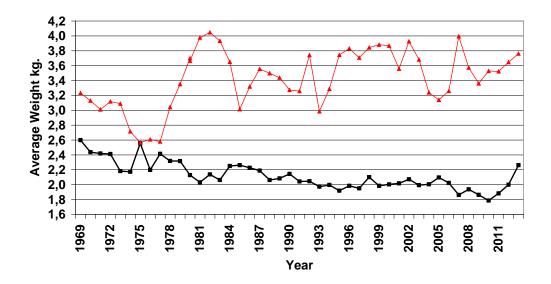

**SKJ-Figure 8.** Cumulative skipjack catches in the western Atlantic, by gear (1950-2016). The values for 2016 are preliminary.

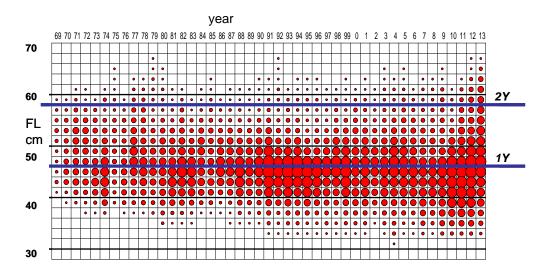

**SKJ-Figure 9.** Changes over time in the carrying capacity, corrected by the annual percentage of time at sea, (left axis) for the overall purse seiners (1971-2016) and baitboats (1971-2016) operating in the eastern Atlantic and in number of boats for the European purse seiners, associated and Ghanaian fleets (right axis). It is possible that the carrying capacity for some segments of the purse seine fleet was underestimated during recent years.

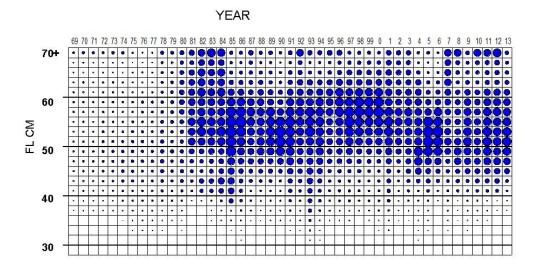

**SKJ-Figure 10.** Number of  $5^{\circ}x5^{\circ}$  squares with annual skipjack catches above 10 t for the European and associated purse seiners operating in the eastern Atlantic (1980-2016). The increase observed in 1991 could be due to a modification of the species composition correction procedure for the catches implemented at that date (skipjack catches could have been attributed to squares that did not have any until then). On the other hand, the recent increase in the successfully exploited surface area is an extension of the fishery towards the western central Atlantic and off the coasts of Mauritania and Angola.

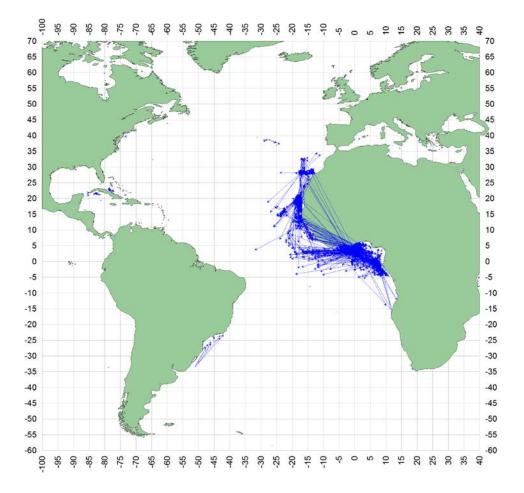

**SKJ-Figure 11.** Changes in the average weight of skipjack in the eastern (black) and western Atlantic (red).

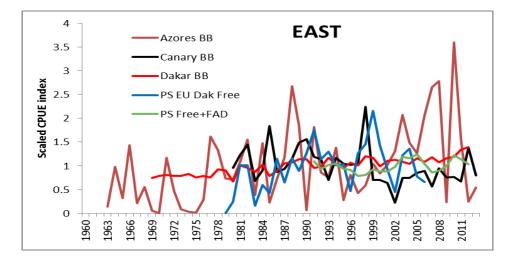

**SKJ-Figure 12.** Distribution of skipjack catch-at-size by size class (2 cm FL size bin) and year for the eastern Atlantic stock. Each bubble represents the proportion of catch weight stratified by size bin and year. The size limits of ages 1 and 2 are indicated by the horizontal lines (blue).

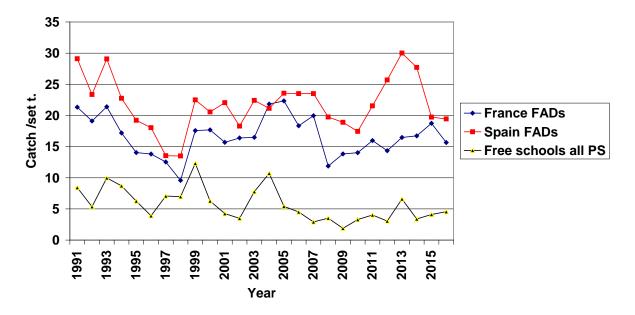

**SKJ-Figure 13.** Distribution of skipjack catch-at-size by size class (2 cm FL size bin) and year for the western Atlantic stock. Each bubble represents the proportion of catch weight stratified by size bin and year.

**SKJ Figure 14.** Apparent movements (straight line distance between the tagging location and that of recovery) calculated from conventional tagging.

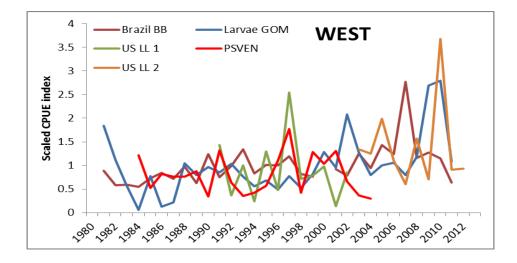

**SKJ-Figure 15.** Relative abundance indices for the eastern skipjack stock. Each index has been adjusted to its own average level given that to resolve problems regarding scaling, the indices for purse seine have been adjusted to the same level as the Azorean baitboat series.

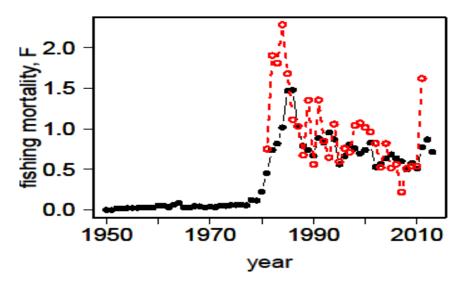

Atlantic SKJ: average catch per >0 FAD sets France & Spain PS, and average cath on free school sets all PS

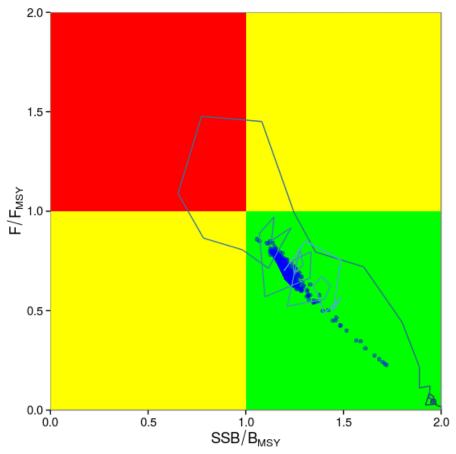

**SKJ-Figure 16.** Catches by set (t) of eastern Atlantic skipjack and on FADs (France and Spain + associated fleets) and on free schools (all purse seiners).

**SKJ-Figure 17.** Relative abundance indices for the western skipjack stock. Each index has been adjusted to its own average level given that to resolve problems regarding scaling, the indices for purse seiners and longliners have been adjusted to the level of the larvae index of the Gulf of Mexico.

# 8.4 ALB - ALBACORE

The status of the North and South Atlantic albacore stocks is based on the most recent analyses conducted in May 2016 by means of using the available data up to 2014. Complete information on the assessment can be found in the Report of the Atlantic albacore stock assessment session.

The status of the Mediterranean albacore stock is based on the 2017 assessment using available data up to 2015. Complete information is found in the Report of the 2017 albacore species group intersessional meeting.

## ALB-1. Biology

Albacore is a temperate tuna widely distributed throughout the Atlantic Ocean and Mediterranean Sea. On the basis of the biological information available for assessment purposes, the existence of three stocks is assumed: northern and southern Atlantic stocks (separated at 5°N) and a Mediterranean stock (**ALB-Figure 1**). However, some studies support the hypothesis that various sub populations of albacore exist in the North Atlantic and Mediterranean. Likewise, there is likely intermingling of Indian Ocean and South Atlantic immature albacore which needs further research.

Scientific studies on albacore stocks, in the North Atlantic, North Pacific and the Mediterranean, suggest that environmental variability may have a serious potential impact on albacore stocks, affecting fisheries by changing the fishing grounds, as well as productivity levels and potential MSY of the stocks. Those yet sufficiently unexplored aspects might explain recently observed changes in fisheries, such as the lack of availability of the resource in the Bay of Biscay in some years, or the apparent decline in the estimated recruitment which are demanding focussed research.

The expected life-span for albacore is around 15 years. While albacore is a temperate species, spawning in the Atlantic occurs in tropical waters. Present available knowledge on habitat, distribution, spawning areas and maturity of Atlantic albacore is based on limited studies, mostly from past decades. In the Mediterranean, there is a need to integrate different available studies so as to better characterize growth of Mediterranean albacore. Besides some additional recent studies on maturity, in general, there is poor knowledge about Mediterranean albacore biology and ecology.

More information on albacore biology and ecology is published in the *ICCAT Manual*.

# ALB-2. Description of fisheries or fishery indicators

#### North Atlantic

The northern stock is exploited by surface fisheries targeting mainly immature and sub-adult fish (50 cm to 90 cm FL) and longline fisheries targeting immature and adult albacore (60 cm to 130 cm FL). The main surface fisheries are carried out by EU fleets (Ireland, France, Portugal and Spain) in the Bay of Biscay, in the adjacent waters of the northeast Atlantic and in the vicinity of the Canary and Azores Islands in summer and autumn. The main longline fleet is the Chinese Taipei fleet which operates in the central and western North Atlantic year round. However, Chinese Taipei fishing effort decreased in the late 1980s due to a shift towards targeting on tropical tuna, and then continued at this lower level to the present. Over time, the relative contribution of different fleets to the total catch of North Atlantic albacore has changed, which resulted in differential effects on the age structure of the stock. Since the 1980s, a reduction of the area fished for albacore was observed for both longline and surface fisheries.

Total reported landings, steadily increased since 1930 to peak above 60,000 t in the early 1960s, declining afterwards, largely due to a reduction of fishing effort by the traditional surface (troll and baitboat) and longline fisheries (**ALB-Table 1**; **ALB-Figure 2a**). Some stabilization was observed in the 1990s, mainly due to increased effort and catch by new surface fisheries (driftnet and mid-water pair pelagic trawl), with a maximum catch in 2006 of 36,989 t and, since then, a generally decreasing trend of catch is observed in the North Atlantic.

The preliminary total reported catch in 2016 was 30,141 t (above the TAC of 28,000 t), and the catch in the last five years has remained about 26,000 t, above the historical minimum of around 15,000 t recorded in 2009. During the last years, the surface fisheries contributed to approximately 80% of the total catch (**ALB-Table 1**). The reported catch for 2016, when compared with the average of the last five years, was similar for EU-Ireland and EU-France, but increased significantly (around 46%) for EU-Spain,

Longline catch contributed to approximately 37% of the total catch during the last five years. During the last decades, both Chinese Taipei and Japan have reduced their fishing effort directed to albacore. In the case of Japan, albacore was taken mainly as by-catch. The catch reported in 2016 for Japan was below the last 5 year average, while for Chinese Taipei it was significantly above.

The trend in mean weight for northern albacore remained stable between 1975 and 2014, ranging between 7 and 11 kg. The mean weight for surface fleets (baitboat and troll) showed a stable trend with an average of 7 kg (range of 4 to 10 kg), and for longline fleets it showed no clear trend with an average of 19 kg, but some important fluctuations between 15 and 26 kg since the 1990 (**ALB-Figure 3a**).

#### South Atlantic

The recent total annual South Atlantic albacore landings were largely attributed to four fisheries, namely the surface baitboat fleets of South Africa and Namibia, and the longline fleets of Brazil and Chinese Taipei (**ALB-Table 1**; **ALB-Figure 2b**). The surface fleets are entirely albacore directed and mainly catch sub-adult fish (70 cm to 90 cm FL). These surface fisheries operate seasonally, from October to May, when albacore are available in coastal waters. Brazilian longliners target albacore during the first and fourth quarters of the year, when an important concentration of adult fish (>90 cm) is observed off the northeast coast of Brazil, between 5°S and 20°S, being likely related to favorable environmental conditions for spawning, particularly of sea surface temperature. The longline Chinese Taipei fleet operates over a larger area and throughout the year, and consists of vessels that target albacore and vessels that take albacore as by-catch, in bigeye directed fishing operations. On average, the longline vessels catch larger albacore (60 cm to 120 cm FL) than the surface fleets.

Albacore landings increased sharply since the mid-1950s to reach values oscillating around 25,000 t between the mid-1960s and the 1980s, 35,000 t until the last decade when they oscillated around 20,000 t. However, total reported albacore landings for 2016 decreased to 13,679 t, which is among the lowest values in the time series. The Chinese Taipei catch in the last years has decreased compared to historical catches, mainly due to a decrease in fishing effort targeting albacore. Chinese Taipei longliners (including boats flagged in Belize and St. Vincent and the Grenadines) stopped fishing for Brazil in 2003, which resulted in albacore only being caught as by-catch in tropical tuna-directed longline fisheries. The significantly higher average catch of about 4,287 t during the period 2000-2003 was obtained by the Brazilian longline fleet when albacore was a target species.

In 2016, the estimated South African and Namibian catch (mainly baitboat), below the average of the last five years. During the last decades, Japan took albacore as by-catch using longline gear, but recently Japan is again targeting albacore and increased the fishing effort in waters off South Africa and Namibia (20-40°S). Thus, catches during the last five years double those in the last few decades.

The trend in mean weight from 1975 to 2014 is shown in **ALB-Figure 3b**. Surface fleets showed a stable trend from 1981 onwards with an average of 13 kg and a maximum and minimum average weight of 17 kg and 10 kg, respectively. Longline fleets showed a relatively stable trend for the mean weight around 17 kg until 1996 where the average weight increased to about 20 kg, oscillating between 16 and 26 kg.

#### Mediterranean

During the last assessment, the catch series was revisited and, after revision, some series were included in the ICCAT database. In 2016, the reported landings were 3,519 t, similar to those in the last decade (**ALB-Table 1** and **ALB-Figure 2c**). The majority of the catch came from longline fisheries. EU-Italy is the main producer of Mediterranean albacore, with around 57% of the catch during the last 10 years. In 2016 the Italian catch remained similar to the last five year average. 2015 was an unusual year in that the fishing pattern was very different as compared to previous years, possibly related to the anticipation of management measures directed to Mediterranean swordfish that modified the fishing strategy in 2015. Therefore, the relative abundance estimates for 2015 CPUE indices were not used in the assessment.

## ALB-3. State of stocks

#### North Atlantic

In the 2013 stock assessment, several model formulations (Multifan-CL, Stock Synthesis, VPA and ASPIC) with varying degrees of complexity were used. This allowed the modeling of different scenarios that represented different hypotheses, and the characterization of the uncertainty around the stock status. The results showed that although the range of estimated management benchmarks was relatively wide, most models were in agreement that the stock was overfished, and no model indicated that the stock was undergoing overfishing. These models from all the various platforms showed a general drop in stock biomass from 1930 to about 1990 and an increasing trend in biomass starting in around 2000. Likewise, most models within all configurations showed a peak in fishing mortality in around 1990 with a decreasing trend thereafter. The analyses conducted in 2013 involved a large amount of data preparation and scrutiny, and the Committee suggested that future assessment updates could be conducted using simpler models (e.g. production models).

Thus, in 2016 a production model was used to assess the stock status. A thorough revision of North Atlantic Task I data was conducted and catch rate analyses were improved and updated with new information for the northern albacore fisheries. Decisions on the final specifications of the base case model were guided by first principles (e.g. knowledge of the fisheries) and data exploration (e.g. correlation between indices). The results of these efforts are reflected in the following summaries of stock status that analyzed data through 2014.

Four longline and one baitboat CPUE indices were selected to be used in a production model framework. The Committee lacked a basis to decide which CPUE series could best represent abundance. In fact, it was assumed that different CPUE series reflected local abundance available to different fleets operating in different areas, and that overall they represented the global population trend. On this basis, the Committee agreed to use all the 5 CPUEs jointly in the base case scenario, and to weight them equally. Despite their variable pattern, these indices showed an overall increasing trend towards the end of the time series (**ALB-Figure 4**), which could be reflecting the increasing trend of the stock during this period of relatively low catch. The Chinese Taipei longline index showed the steepest increase during the last years of the series.

The biomass dynamic model results for the base case suggest a biomass drop between 1930 and the 1990s and a recovery since then, while fishing mortality decreases. Relative to MSY benchmarks, the base case scenario estimates that the stock remained slightly overfished with B below  $B_{MSY}$  during the 1980s and 1990s, but now has recovered to levels well above  $B_{MSY}$  (**ALB-Figure 5**). Peak relative fishing mortality levels in the order of 1.4 were observed in the early 1980s but overfishing stopped in the 1990s, current  $F_{2014}/F_{MSY}$  ratio being 0.54. The uncertainty around the current stock status has a clear shape determined by the strong correlation between parameters estimated by the production model. The probability of the stock currently being in the green area of the Kobe plot (not overfished and not undergoing overfishing,  $F < F_{MSY}$  and  $B > B_{MSY}$ ) is 96.8% while the probability of being in the yellow area (overfished,  $B < B_{MSY}$ ) is 3.2%. The probability of being in the red area (overfished and undergoing overfishing,  $F > F_{MSY}$  and  $B < B_{MSY}$ ) is 0% (**ALB-Figure 6**).

Sensitivity analyses revealed that recent stock status indicators are sensitive to different modelling assumptions as well as the choice of the CPUE series. When a logistic function was assumed in the biomass dynamic model lower values of  $B/B_{MSY}$  were predicted over the whole time series, while excluding the Chinese-Taipei longline CPUE resulted in much larger values of  $B/B_{MSY}$  in the recent period. Other sensitivity analyses did not show strong deviations from the base case. However, although the recent status varied across scenarios, all predicted the stock to be in the green quadrant. Finally, the Committee noted that the  $B/B_{MSY}$  trajectory showed a strong retrospective pattern that might imply that the current stock status is overestimated, although all the retrospective trajectories showed an improvement in stock status in the most recent period.

In summary, the available information indicates that the stock has improved and is most likely in the green area of the Kobe plot, although the exact condition of the stock is not well determined.

# South Atlantic

In 2016, a stock assessment of South Atlantic albacore was conducted including catch, effort and size data up until 2014, and considering similar methods as in the previous assessment.

The southern standardized CPUE trends are mainly for longline fisheries, which harvest mostly adult albacore. The longest time series of Chinese Taipei, showed a strong declining trend in the early part of the time series, and less steep decline over the last three decades, similar to the Japanese longline index. However, the Uruguayan longline CPUE series showed significant decreases since the 1980s (ALB-Figure 7).

In the 2016 assessment, the same eight scenarios as in 2013 were considered, but after screening during the assessment meeting, the early Japanese CPUE series was not used to fit the models. Stock status results varied significantly among scenarios (ALB-Figure 8a). Two different production model forms were considered, each with four scenarios. One showed more optimistic results than the other. However, the Committee lacked enough objective information to identify the most plausible scenarios and considered them equally likely. Six of eight scenarios indicated that the stock is not overfished and not undergoing overfishing, and two other scenarios indicated that the stock is overfished but not undergoing overfishing. Six scenarios estimated a higher B/B<sub>MSY</sub> than in the last stock assessment, and seven scenarios estimated a lower F/F<sub>MSY</sub> than in the previous assessment. This indicated that current stock status has improved since the last assessment. Considering the whole range of scenarios, the median MSY value was 25,901 t (ranging between 15,270 t and 31,768 t), the median estimate of current B/B<sub>MSY</sub> was 1.10 (ranging between 0.51 and 1.80 t) and the median estimate of current F/F<sub>MSY</sub> was 0.54 (ranging between 0.31 and 0.87). The wide confidence intervals reflect the large uncertainty around the estimates of stock status. Considering all scenarios, there is 3% probability for the stock to be both overfished and experiencing overfishing, 31% probability for the stock to be either overfished or experiencing overfishing but not both, and 66% probability that biomass is above and fishing mortality is below the Convention objectives (ALB-Figure 8b).

#### Mediterranean

In 2017, the stock assessment for Mediterranean albacore was conducted using catch data up until 2015 and CPUE data up until 2014. The methods used were coherent with "limited data" category of this stock. The methods applied included a length-based catch curve analysis and a bayesian state space surplus production model (JABBA).

Two standardized CPUE series for EU-Spain and EU-Italy longline fisheries were used during this last assessment (**ALB-Figure 9**). In addition, a larval index independent of the fishery, providing information on the trends of the spawning biomass, was used. The three indices showed a decreasing trend for the period 2013-2014.

The results of the 2017 assessment, based on the limited information available, show that the status of the stock is highly uncertain with respect to both fishing mortality and biomass. Despite the high uncertainty, the results would seem to indicate that recent albacore median biomass levels are at about  $B_{MSY}$ , and median fishing mortality levels are below  $F_{MSY}$  (**ALB-Figure 10a**). The probability to be in the red, yellow and green parts of the Kobe plot is 35.7%, 15.8% and 48,5%, respectively (**ALB-Figure 10b**).

However, the Group noted the lack of CPUE estimates in 2015. Given the recent downward trends of the available series, it is very important to corroborate, in the coming years, whether this trend continues or not. However, the Committee reiterates that the ability to monitor stock trends is limited, and that the currently used fishery dependent indices might be affected by the ban imposed as part of the swordfish recovery plan.

# ALB-4. Outlook

# North Atlantic

In 2016, the estimated population was projected under both alternative TACs and HCRs, as combinations of target fishing mortality ( $F_{TAR}$ ), threshold biomass ( $B_{THRESH}$ ) and an interim biomass limit reference point ( $B_{LIM}$ ) of 0.4  $B_{MSY}$  (**ALB-Figure 11**). The projections assuming catch levels similar to those observed during the last five years (between 25,000 t and 30,000 t) or the current TAC (28,000 t) suggest that biomass would continue to increase and are likely sustainable. The Committee noted that the new projections suggested higher sustainable catch levels compared to most of the previous assessments. However, the Committee

had little trust in the absolute biomass estimate and the projections did not fully account for many other sources of uncertainty (i.e. model structure and assumptions) that need further evaluation. Thus, the Committee did not have confidence in the projections and the Kobe 2 Strategy Matrix and decided not to provide or use these analyses for advice.

During 2017, considering that Rec. 16-06 requested the SCRS to "refine the testing of candidate reference points (e.g., SSB<sub>THRESHOLD</sub>, SSB<sub>LIM</sub> and F<sub>TARGET</sub>) and associated harvest control rules (HCRs) that would support the management objective", a set of alternative HCRs were tested by projecting a wide range of simulated albacore populations in a management strategy evaluation (MSE) framework. The MSE used was tailored specifically to support the process to discuss and eventually adopt a HCR for North Atlantic albacore in 2017 but not to provide TAC recommendation. As such, the simulated management procedure was consistent with the 2016 assessment approach, and thus, if the Commission selects a HCR, it would be appropriate to apply it to the outcome of the 2016 stock assessment to set the TAC for the next three years. However, as every MSE process, this framework can be further improved and expanded in the future (e.g. by exploring alternative management procedures).

Although a larger set of HCRs have been tested, following the advice of the Standing Working Group to Enhance Dialogue between Fisheries Scientists and Managers (SWGSM), a reduced number of eight HCRs is finally considered. Eight HCRs are all the combinations of the following elements: two alternative target fishing mortalities (0.8 and 1 x  $F_{MSY}$ ); two threshold biomasses (0.8 and 1 x  $B_{MSY}$ ); and 2 stability clauses. The 2 stability clauses were: (SC1) maximum change in TAC of 20% always applied from one 3-year management period to the next while also always imposing a 15,000-50,000 t min-max TAC; and (SC2) same as (SC1) but not restricting TAC reductions and not imposing a minimum TAC when B<B<sub>THR</sub>.

All HCRs tested met the objective to be in the green quadrant of the Kobe plot with a probability higher than 60% (**ALB-Table 2**). 96% of the OMs showed biomass above  $B_{MSY}$  with 60% probability between 2020-2045. HCRs with higher target fishing mortalities ( $F_{MSY}$ ) were associated with lower probabilities of being in the Kobe green quadrant, higher probabilities of the stock being between  $B_{lim}$  and  $B_{thr}$ , and slightly higher long term yields. The different stability clauses had important effects on long term yield and stability. In SC1 (maximum change in TAC of 20% always allowed), higher stability and higher long term yields were achieved, compared to SC2 (**ALB-Figure 12**, **ALB-Table 2**). Note that Table 2 was prepared for the comparison of the performance of alternative HCRs, but not for actual TAC calculation. For more detail on the MSE, please refer to Responses to the Commission 20.16 and 17 as well as the 2017 albacore working group intersessional meeting report.

Whichever HCR is selected, its application will result in a short-term TAC of 33,600 t which results from the maximum 20% increase from the current level; this conforms to the positive stock status estimated in the 2016 assessment.

# South Atlantic

The projection results differ between the base case scenarios. Since there is not objective information with which to select which scenario is most plausible, the Committee considered the entire range of scenarios, thus characterizing the range of possible responses to the distinct catch levels projected, as done in 2013. The Kobe matrix indicates that, depending on the scenario, catches which enable the stock to be in the Kobe green zone in 2020 with at least a 60% probability ranged from 18,000 to 34,000 t, with an average of 25,750 t and a median of 26,000 t (**ALB-Table 3**). Averaging all scenarios, projections at a level consistent with the 2016 TAC (24,000 t) showed that probabilities of being in the green area of the Kobe plot would be higher than 60% in 2020 (**ALB-Table 3**).

Projections at  $F_{MSY}$ , without considering implementation errors, suggested that the probability of the stock to be in the green quadrant of the Kobe plot would not consistently increase over time, while it would when projected at  $0.95*F_{MSY}$  or any lower fishing mortality rate.

## Mediterranean

Due to the limited quantitative information available to the SCRS, the sensitivity of the stock assessment to different sources of information, and the limited prediction skill of the assessment model, the projections for this stock were not conducted. As a result, future stock status in response to constant catch levels could not be quantified.

## ALB-5. Effect of current regulations

## North Atlantic

In 2016, the Commission established a TAC for 2017-2018 of 28,000 t [Rec. 16-06], but included several provisions that allow the catch to exceed this level. The Committee noted that, since the establishment of the TAC in the year 2001, catch remained substantially below the TAC in all but three years, including 2016 (**ALB-Figure 2**). This might have accelerated rebuilding over the last decade, but the Committee did not test the effect of perfect implementation of the TAC.

Furthermore, [Rec. 98-08] that limits fishing capacity to the average of 1993-1995, remains in force. The effect of this recommendation has not been evaluated but a general decrease of fishing mortality is observed since its implementation.

## South Atlantic

In 2016 the Commission established a new TAC of 24,000 t for 2017-2020 [Rec. 16-07]. The Committee noted that, since 2004, reported catches remained below 24,000 t, except in 2006, 2011 and 2012, where reported catches were slightly above this value (**ALB-Table 1**). As in the case of the North Atlantic, the Committee did not test the effect of perfect implementation of the TAC.

## Mediterranean

Although there are no ICCAT regulations directly aimed at managing the Mediterranean albacore stock, as a result of the Mediterranean swordfish rebuilding plan (Rec. 16-05), a time closure of two months (1 October - 30 November), originally aimed at protecting the Mediterranean swordfish juveniles, applies to the longline fleet targeting albacore in the Mediterranean from 2017 onwards. Furthermore, a list of vessels authorized to target Mediterranean albacore was implemented in 2017.

#### ALB-6. Management recommendations

#### North Atlantic

Recommendation 16-06 sets the objective of maintaining the stock in the green area of the Kobe plot with a 60% probability while maximizing long-term yield, and, if  $B < B_{MSY}$ , to recover it as soon as possible, while maximizing average catch and minimizing inter-annual fluctuations in TAC levels.

In 2016, the Committee noted that the relative abundance of north Atlantic albacore had continued to increase over the last decades and was likely somewhere in the green area of the Kobe plot. However, without additional information, the magnitude of the recovery was not well determined and remains sensitive to many different assumptions. This undermined the ability of the Committee to reliably quantify the effects of future TAC or HCR scenarios on the status of the stock, until more sources of uncertainty and the robustness of the advice were evaluated in the future through MSE and/or benchmark stock assessment after accumulating sufficient new information. The projections assuming catch levels similar to those observed during the last five years (between 25,000 t and 30,000 t) or the current TAC (28,000 t) suggested that biomass would continue to increase and are likely sustainable. Based on the analyses conducted in 2016 as well as in 2013, the Committee believed that the current TAC would maintain the long-term objectives of the Commission as specified in Rec. 16-06. Given the uncertainty around the current stock status and the projections, the Committee was unable to provide advice on risks associated with an increase in the TAC. Therefore, the Committee did not recommend an increase of the TAC based on the 2016 assessment. Further, the Committee reminded the Commission that our ability to monitor changes in stock abundance is currently limited due to incomplete fishery dependent information. Thus, it is desirable to pursue alternative fishery independent tools to provide improved bases for monitoring stock condition.

Although the SCRS will continue working in reviewing and improving the MSE for northern albacore, the MSE simulations conducted in 2017 allows the Committee to provide advice that is robust to a wide range of uncertainties, including those affecting the 2016 assessment. The performance of the HCRs is measured according to the indicators adopted by Panel 2 (Rec. 16-06 annex 2). However, it should be noted that the Committee has identified several concerns in the evaluation of HCR performances, but has not yet been able to fully characterize the implications for the implementation of the selected HCR. As there is currently no clear indication that any of these concerns is sufficient to preclude the HCR implementation, the Committee agrees that the Commission could select a HCR based on the current results presented here and, according to Rec. 16-06, set an annual constant TAC for the following 3 years. However, the Committee cautions that any such adoption of an HCR should be done on an interim basis, contingent on future advice of the SCRS based on its ongoing review of these HCRs.

Based on the current MSE results, the implementation of any of the tested HCRs will meet the objective to be in the green quadrant of the Kobe plot (with a probability higher than 60%) (**ALB-Table 2**). In HCRs where maximum change in TAC of 20% is always applied (SC1), higher stability and higher long term yields are achieved, compared to HCRs where the 20% restriction for decrease is not used when B<B<sub>threshold</sub> (SC2). Not restricting TAC reductions improves safety and might allow quicker recoveries if the stock is really overexploited, but can also cause large unnecessary TAC reductions, or even fishery closures, when the stock is healthy but it is wrongly perceived to be overexploited.

Whichever HCR is selected, its application will result in a short-term 3 years TAC of 33,600 t which results from the maximum 20% increase from the current level; this conforms to the positive stock status estimated in the 2016 assessment. It should be noted that, as any interim HCR would directly apply to the result of future stock assessments, future TAC can change widely if the assessment results change with the incorporation of the most recent information. It should also be noted that there is an extensive workplan to validate and improve the MSE framework used in the evaluation of HCRs. In that case, the realized yield could also change in the short term if an updated HCR is adopted in the future based on such improvements.

## South Atlantic

Results indicate that, most probably, the South Atlantic albacore stock is not overfished and that overfishing is not occurring. However, there is considerable uncertainty about the current stock status, and the effect of alternative catch limits on the rebuilding probabilities of the southern stock. The different model scenarios considered in the south Atlantic albacore stock assessment provide different views on the future effects of alternative management actions. Projections at a level consistent with the 2016 TAC (24,000 t) showed that probabilities of being in the green quadrant of the Kobe plot across all scenarios would increase to 63% by 2020. Further reductions in TAC would increase the probability of being in the green zone in those timeframes. On the other hand, catches above 26,000 t will not permit maintaining the stock in the green area with at least 60% probability by 2020 (**ALB-Table 3 and 4**).

# Mediterranean

Unfortunately, limited quantitative information is available to the SCRS for use in conducting a robust quantitative characterization on biomass status relative to Convention objectives. Recent fishing mortality levels appear to be below  $F_{MSY}$ , and current biomass is approximately at  $B_{MSY}$  level. However, there is considerable uncertainty about current stock status. For this reason, the Commission should institute management measures designed to avoid increases in catch and effort directed at Mediterranean albacore. The analyses suggest that catch levels as high as those in the years 2006-2007 (beyond 5,900 t) proved to be clearly unsustainable. Moreover, recent catches for this stock are close to the estimated MSY. Considering the high uncertainty regarding the most recent abundance trends, the Committee recommends to maintain catches below MSY at least until these abundance trends are updated. The precise level of catch would depend on the level of risk the Commission is willing to take.

	ATLANTIC AND MEDITERRA	ANEAN ALBACORE SUMMARY

**ALB-Table 2.** Performance of 8 HCRs, according to the performance statistics defined by Panel 2 (only one performance indicator per block is shown, which represents median values across 132 operating models). The combination of the target fishing mortality ( $F_{tar}$ ), Biomass threshold ( $B_{thresh}$ ) and the type of stability clause defines the HCR. Two stability clauses were considered: (SC1) maximum change in TAC of 20% always applied from one 3-year management period to the next while also always imposing a 15,000-50,000 t min-max TAC; and (SC2) same as SC1 but not restricting TAC reductions and not imposing a minimum TAC when B<B<sub>THR</sub>. Each HCR has a unique identification number in this table and in ALB-Figure 12. pGR% = probability of being in the green quadrant of the Kobe plot; pBint% = probability of B<sub>thr</sub>>B>B<sub>lim</sub>; LongY (kt) = mean yield for the period 2030-2045 in thousands of tonnes; MAP = mean absolute proportional change in catch.

		HCR		Stock Status	Safety	Catch	Stability
Number	Ftar	Bthresh	Stability clause	pGr%	pBint%	LongY (kt)	MAP (%)
1	0,80	0,80	SC2	85,5	9,0	26,5	8,3
2	1,00	0,80	SC2	78,9	13,0	29,0	8,8
3	0,80	1,00	SC2	88,6	8,3	26,9	8,3
4	1,00	1,00	SC2	84,5	9,2	26,9	8,9
1	0,80	0,80	SC1	85,8	9,3	32,1	5,6

3	0,80	1,00	SC1	86,0	10,4	32,2	6,0
4	1,00	1,00	SC1	77,9	14,3	35,0	6,3

**ALB-Table 3.** South Atlantic Albacore. Maximum catch which enables the stock to be in the Kobe green zone in 2020 with a probability higher than 60%, for each ASPIC and BSP run. Average and median across runs is also provided.

Model	Run	Catch
ASPIC	Run2	26,000
	Run6	24,000
	Run7	26,000
	Run8	26,000
BSPM	EQ SH	30,000
	EQ FOX	34,000
	CW SH	22,000
	CW FOX	18,000
Average	9	25,750
Median		26,000

**ALB-Table 4.** South Atlantic albacore estimated probabilities (in %) that the South Atlantic albacore stock fishing mortality is below  $F_{MSY}$  (a), biomass is above  $B_{MSY}$  (b) and both (c). Projections for constant F and constant catch levels are shown, combining all base case scenarios.

(c) Probability of green status ( $B>B_{MSY}$  and  $F<F_{MSY}$ ).

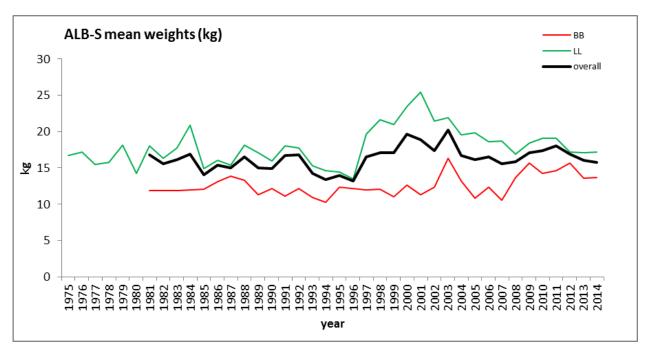

**ALB-Figure 1.** Geographic distribution of albacore accumulated catch by major gears and decade (1960-2015). Baitboat and troll catches prior to the 1990s, these catches were assigned to only one  $5^{\circ}x5^{\circ}$  stratum in the Bay of Biscay. Plots are scaled to the maximum catch observed from 1960 to 2015 (last decade only covers 6 years).

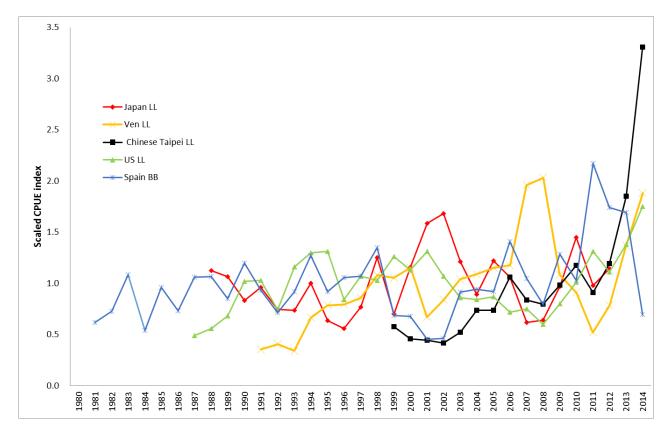

**ALB-Figure 2a, b, c**. Total albacore catches reported to ICCAT (Task I) by gear for the northern, southern Atlantic stocks including TAC, and the Mediterranean stock.

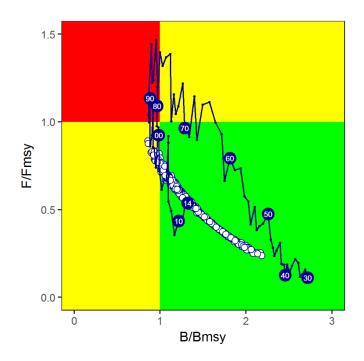

b)

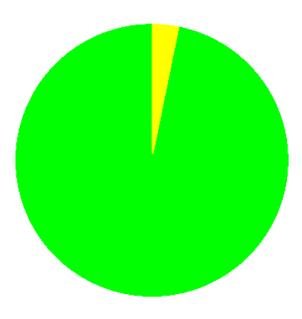

**ALB-Figure 3a, b**. Mean weight trend by surface and longline fisheries in North Atlantic (a) and South Atlantic (b) stocks. The baitboat fishery in the South Atlantic started in 1979 and mean weights are provided from 1980 onwards.

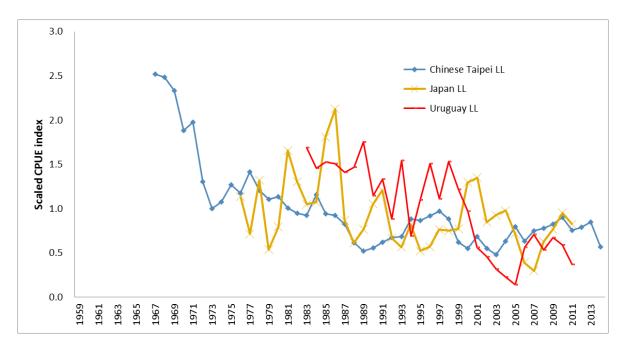

**ALB-Figure 4**. North Atlantic albacore. Standardized catch rate indices used in the 2016 stock assessment from the surface fisheries, which take mostly juvenile fish, and from the longline fisheries, which take mostly adult fish.

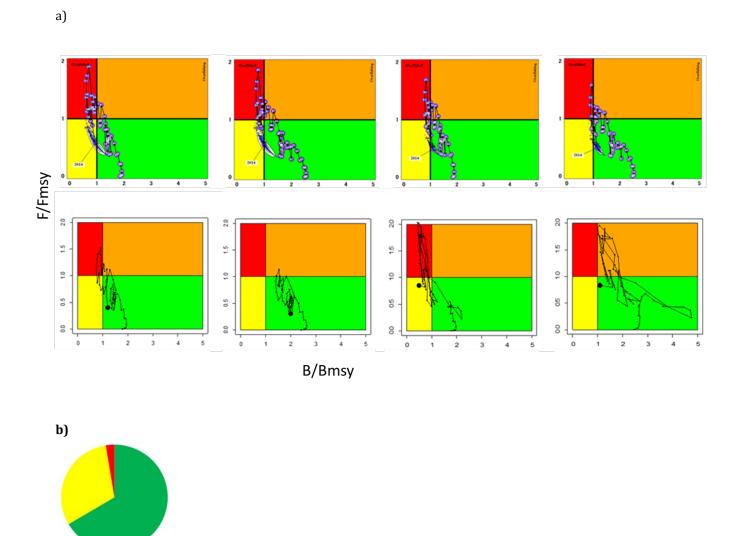

**ALB-Figure 5.** North Atlantic albacore. Joint trajectories of  $B/B_{MSY}$  and  $F/F_{MSY}$  over time (1930-2014) and current stock status according to the Base Case biomass dynamic model. Dots represent the uncertainty on the estimated 2014 stock status.

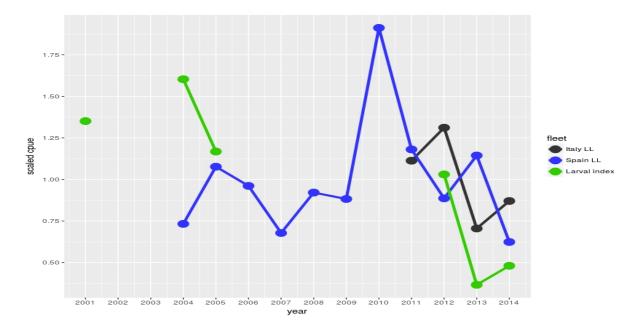

**ALB-Figure 6.** North Atlantic albacore probability of being overfished and overfishing (red, 0%), of being neither overfished nor overfishing (green, 96.8%), and of being overfished (yellow, 3.2%), according to the Base Case.

(b) Probability of being overfished and overfishing (red, 36%), of being neither overfished nor overfishing (green (48%), and of being overfished or overfishing, but not both (yellow, 16%).

**ALB-Figure 11.** Generic form of the HCR recommended by SCRS (SCRS, 2011). Blim is the limit biomass reference point, BThreshold is the biomass point at which increasingly strict management actions should be taken as biomass decreases and Ftarget, the target fishing mortality rate to be applied to achieve the management objective [Rec. 16-06].

**ALB-Figure 12.** Spider plots representing the relative performance of HCRs with alternative stability clauses: SC1 (below pannel), maximum change in TAC of 20% always applied from one 3-year management period to the next while also always imposing a 15,000-50,000 t min-max TAC; and (SC2) same as SC1 but not restricting TAC reductions and not imposing a minimum TAC when B<B<sub>THR</sub>. Among the 15 performance statistics identified by Panel 2, a single performance statistic per main group (namely stock status, stability, yield and safety) is represented in each of the axes. Each HCR has a unique identification number in this figure and ALB-Table 2. Different tickmarks in the axes are included to inform about absolute values. The exact values for all the HCRs can be seen in ALB-Table 2.

## 8.5 BFT - ATLANTIC BLUEFIN TUNA

Recent assessments of both the eastern and western stocks have attempted to develop Kobe plots and matrices depicting the status of the stock relative to certain reference points, despite a general consensus that they did not adequately reflect the true range of uncertainties. The long-term recruitment potential in particular is unknown and probably changes over time. Mindful of the Commission's request for Kobe matrices, the WBFT Group has in the past, attempted to bracket the long-term recruitment potential with "high" and "low" scenarios based on two different spawner-recruit relationships fit to recruitment estimates from different periods of years. Similarly, the EBFT Group has attempted to bracket the range of possibilities with three different constant recruitment scenarios corresponding to the averages taken over three different periods. This bracketing approach has not proven especially helpful in either case because the range of possibilities is so large.

Despite considerable efforts to improve the historical data for both stocks, the 2017 Committee has not gained any further insights into future recruitment potential. As any additional improvements to the historical data are likely to be rather modest in scope, the Group expects such insights to remain elusive. Moreover, the Convention objective of stabilizing the stock near the level that will produce the maximum sustainable catch by its very nature tends to prevent the stock from reaching the high and low levels needed to provide adequate contrast for estimating the spawner-recruit relationship. Accordingly, the Group has elected to focus on fishing-mortality based reference points that do not require knowledge of long-term recruitment potential, but nevertheless can be implemented in a manner that will eventually approach and maintain the stock near the corresponding biomass reference point.

It is not possible to calculate biomass-based reference points (e.g., MSY and  $F_{MSY}$ ) apart from the knowledge (or assumptions) about how future recruitment potential relates to spawning stock biomass. In the absence of such knowledge, several F reference points have been recommended in the literature as proxies for  $F_{MSY}$ . The reference point of choice for the Eastern stock has been  $F_{0.1}$  since 2008. The 2017 Committee considers  $F_{0.1}$  to be a reasonable proxy for the western stock as well. Accordingly, the Committee has provided Kobe matrices for both stocks that reflect the probability of not overfishing (F<F\_{0.1}). Yields associated with  $F_{0.1}$  can be higher or lower than MSY-based yields, depending on the spawner-recruit relationship. Further, the status of the stock relative to the corresponding long-term biomass,  $B_{0.1}$ , is considered unknown because the spawner-recruit relationship is unknown. Nevertheless, fishing consistently at  $F_{0.1}$  will, over the long-term cause the stock to fluctuate around  $B_{0.1}$ , whatever the future recruitment potential.

Although the Committee was unable to provide reliable biomass reference points, the new information available through GBYP and other programmes improved the assessment in many ways, which are documented in the reports of the data preparatory and stock assessment meetings. Therefore the Committee considers the following advice to be more reliable than previously provided to the Commission.

# BFT-1. Biology

Atlantic bluefin tuna (BFT) have a wide geographical distribution but mainly live in the temperate pelagic ecosystem of the entire North Atlantic and its adjacent waters, for example the Gulf of Mexico, Gulf of St. Lawrence and the Mediterranean Sea. Recent information for their presence in the South Atlantic is incomplete (**BFT-Figure 1**). Archival tagging information confirmed that bluefin tuna can sustain cold as well as warm temperatures while maintaining a stable internal body temperature. Bluefin tuna preferentially occupy the surface and subsurface waters of the coastal and open-sea areas, but archival tagging and ultrasonic telemetry data indicate that they frequently dive to depths of more than 1,000 m. Bluefin tuna are a highly migratory species that seems to display a homing behavior and spawning site fidelity to primary spawning areas in both the Mediterranean Sea and Gulf of Mexico. Recent evidence indicates that spawning also occurs in the vicinity of the Slope Sea, though its persistence and its importance remains to be determined. Electronic tagging is also resolving the movements to the foraging areas within the Mediterranean and the North Atlantic and indicate that bluefin tuna movement patterns vary by tagging site, by month of tagging and according to the age of the fish. The reappearance of bluefin tuna in historical fishing areas and north temperate waters suggest that important changes in the spatial dynamics of bluefin tuna may also have resulted from interactions between biological factors, environmental variations and the reduction in fishing effort. The Atlantic bluefin tuna population is managed as two stocks, conventionally separated by the 45°W meridian, however efforts to understand the population structure through tagging, genetic and microchemistry studies indicate that mixing is occurring at various rates in the eastern, western and northwestern Atlantic.

The ICCAT GBYP biological sample database provided the basis for improved biological studies. Substantial progress has been made in estimating regional, time varying mixing levels for Atlantic bluefin tuna throughout the Atlantic, using otolith stable isotope and genetic analyses. Research on larval ecology of Atlantic bluefin tuna has advanced in recent years through oceanographic habitat suitability models. Direct age estimations, using otoliths and dorsal fin spine, have been calibrated between readers from several institutions resulting in stock specific age length keys and a new growth model for the western population.

Currently, the SCRS assumes for assessment purpose that eastern Atlantic and Mediterranean bluefin tuna contribute fully to spawning at age 5. Recent information received by the SCRS indicates that some young individuals (age 5) of unknown origin caught in the West Atlantic were mature, but there was considerable uncertainty with regards to their contribution to the western stock spawning. Therefore, for the western stock the SCRS considered two spawning schedules; one identical to that used for the East and one with peak spawning at age 15. Juvenile and adult bluefin tuna are opportunistic feeders (as are most predators). However, in general, juveniles feed on crustaceans, fish and cephalopods, while adults primarily feed on fish such as herring, anchovy, sand lance, sardine, sprat, bluefish and mackerel. Juvenile growth is rapid for a teleost fish, but slower than other tuna and billfish species. Fish born in June attain a length of about 30-40 cm long and a weight of about 1 kg by October. After one year, fish reach about 4 kg and 60 cm long. At 10 years old, a bluefin tuna is about 200 cm and 170 kg and reaches about 270 cm and 400 kg at 20 years. Bluefin tuna is a long-lived species, with a lifespan of about 40 years, as indicated by radiocarbon deposition and can reach 330 cm (SFL) and weight up to 725 kg.

Important electronic and conventional tagging activity on both juveniles and adult fish has been performed in recent years in the Atlantic and Mediterranean by ICCAT GBYP, national programmes and NGOs. Contribution of PSAT data from all groups are supporting ongoing efforts to provide significant insight into bluefin tuna stock structure, mixing and migrations and would possibly help in estimating fishing mortality rates and condition the MSE operating model.

The Committee believes that, the two stocks share many biological characteristics and the natural mortality rate have to be similar in magnitude and decline with age. Thus, the Committee revised the natural mortality assumptions and adopted a single new age specific natural mortality curve for both stocks.

#### BFTE-2. Fishery trends and indicators -East Atlantic and Mediterranean

It is very well known that introduction of fattening and farming activities into the Mediterranean in 1997 and good market conditions resulted in rapid changes in the Mediterranean fisheries for bluefin tuna mainly due to increasing purse seine catches. In the last few years, a high percentage of the Mediterranean bluefin fishery production was exported. Declared catches in the East Atlantic and Mediterranean reached a peak of over 50,000 t in 1996 and then decreased substantially, stabilizing around TAC levels established by ICCAT for the most recent period (**BFTE-Figure 2**). Both the increase and the subsequent decrease in declared production occurred mainly for the Mediterranean (**BFTE-Figure 2**). Since 2008, there was a significant decrease in the reported catch following more restrictive TACs and a substantial increase in monitoring, control and surveillance. Catches between 2012 and 2016 was 10,934 t, 13,244 t, 13,261 t, 16,201 t and 20,098 t for the East Atlantic and Mediterranean, of which 7,100 t, 9,081 t, 9,343 t, 11,360 t and 13,162 t was reported for the Mediterranean for those same years (**BFT-Table 1**).

Information available has demonstrated that catches of bluefin tuna from the East Atlantic and Mediterranean were seriously under-reported between the mid-1990s through 2007. The Committee has estimated that realized catch during this period likely was on the order of 50,000 t to 61,000 t per year based on the number of vessels operating in the Mediterranean Sea and their respective catch rates. The current assessment uses these estimates (1996-2007) rather than the declared catches.

CPUE indices (**BFTE-Figure 3**) have been affected significantly by Regulatory measures through the change of operational patterns, length of the fishing season and target sizes; thus it is difficult to distinguish the effect of these changes on CPUEs from the effects of changes in abundance. Some indices showed very rapid increases in the most recent years and the Committee questioned if these rates of increase were biologically plausible indicators of the stock biomass as a whole, and noted that many factors may have contributed to the increase in the index.

Nonetheless, recent tendencies in the indicators are partly a reflection of positive outcomes from recent management measures.

During the stock assessment meeting, held in July 2017, it was decided to use ten indices for the 2017 stock assessment (7 CPUE series and 3 fisheries independent index, **BFTE-Figure 3**). Two new fishery-independent indices were introduced that displayed an increasing trend in the recent years. The French aerial survey for juvenile bluefin tuna in the northwest Mediterranean Sea was split into two series (2000-2003 and 2009-2015). The larval survey in the western Mediterranean (Balearic Islands) covered the periods 2001-2005 and 2012-2015. A new combined Morocco and Portuguese trap index was used for 2012 to 2015. The Japanese longline index in the Northeast Atlantic was split in 2010. Both indices remained steady in the most recent years.

Three indices were updated after the assessment period: the French aerial survey (updated to 2016), the Japanese longline index in the Northeast Atlantic (updated to 2017) and the combined Moroccan and Portuguese traps (updated to 2016). The values of the updated indices remained steady or increased since 2015.

# BFTE-3. State of the stock

There have been considerable improvements in the data quality and quantity over the past few years, nevertheless there remain important gaps in the temporal and spatial coverage for detailed size and catcheffort statistics for several fisheries prior to 2014, especially in the Mediterranean. The Committee does not expect that there can be further improvement in historical statistics.

Five stock assessment platforms were used and explored for the current assessment but only the VPA results were considered sufficiently advanced at the conclusion of the meeting to be considered as the primary basis for management advice for the eastern stock. Nevertheless, there was still concern over the performance of the VPA, notably the unstable estimation of total biomass (i.e. the estimating of a substantial overall increase in biomass with the addition of only the last year of data) and that the size composition of many eastern Atlantic and Mediterranean fleets is poorly characterized for a number of years before the implementation of stereo video camera in 2014.

The original base case VPA selected during the stock assessment meeting was revised to reduce the uncertainties of its estimates in recruitment levels (2004-2007) as assessment-model-independent analyses of size composition data indicated that the original assessment was overestimating the sizes of these year classes relative to the 2003 year class as was also evident from the retrospective analysis. A slight modification of the original base case with more plausible recruitment estimates was adopted as the new base case (see SCRS/2017/188).

The 2017 assessment results from the VPA base case, indicated that the spawning stock biomass (SSB) peaked in the mid-1970s after increasing initially and then declined until 1991 and remained steady up to the mid-2000s. From the late 2000's, SSB exhibited a substantial increase through 2015 (**BFTE Figure 4**). The extent of that increase depends on the choices of model configuration and the indices of abundance and terminal year (2014 vs 2015). The 2014 assessment estimated extraordinarily large year classes in 2004-2007 while in the current assessment recruitment estimates declined from 2002 to 2009 followed by an increase in 2011.

The estimated fishing mortality rates on the younger ages (i.e., average F for ages 2 to 5) displayed a continuous increase until the late 1990s and then showed a sharp decline to reach very low levels after the late 2000s (**BFTE Figure 4**). This result is consequence of the dramatic reduction in the catches at ages 2 to 3 in the recent years in response to the new minimum size regulations implemented in 2007. The trend of F in young ages was similar to that in the 2014 assessment. For oldest fish (F at plus group for ages 10 and older) showed (**BFTE Figure 4**) an initial decline from 1968 to 1973, and slightly fluctuated around 0.03 afterwards. It increased in 1994 and continued increasing up to 2007 ( $F_{10+}=0.2$ ). This period (from the mid-1990s to the mid-2000s) observed the highest level on fishing mortality of larger fish. Since 2008, there has been a rapid decrease in  $F_{10+}$ , as already noted in the previous assessments, which related to the regulation, i.e. the drastic reduction of TAC.

F0.1 was considered a reasonable proxy for  $F_{MSY}$ , although it can be higher or lower than  $F_{MSY}$  depending on the stock recruitment relationship, which in this case is poorly determined. However given the uncertainties about future recruitment, estimates of biomass base reference points were unreliable. In addition to those uncertainties, the current perception of the stock status was also closely related to the assumptions made about stock structure and migratory behaviour, which remain poorly known. Nonetheless, compared to 2014 the extra data now available do better confirm recent stock increase though the level of increase remains difficult to quantify.  $F_{cur}$  appears to be clearly below  $F_{0.1}$   $F_{cur}/F_{0.1}$ = 0.34. The current status of the stock, and status in 2022 under a F0.1 strategy, relative to B0.1 depends on assumptions made for longer term future recruitment. For medium<sup>1</sup> and low recruitment levels, the stock is already above  $B_{0.1}$ , whereas for the high level it is below.

If an  $F_{0.1}$  strategy were to continue to be applied, over the longer term the resource would fluctuate around the true, but unknown value of  $B_{0.1}$  whatever the future recruitment level.

## BFTE- 4. Outlook

In 2017, the Committee presented short-term projections (2017-2022, **BFTE Figure 5**) using the average recruitment over a six year period (2006-2011) and replacing the last four years (2012-2015) recruitments, which are considered poorly estimated, with that average. According to the base model annual constant catches up to 36,000 t have higher than 60% probability of maintaining F below  $F_{0.1}$  throughout 2022 (**BFTE Table 1**).

Projections are known to be impaired by various sources of uncertainties that have not yet been fully quantified. Due to the limited possibility of improving the quality of the data the Committee does not expect to provide further clarity regarding future recruitment therefore the Kobe matrix is presented only in terms of the probability that F is less than  $F_{0.1}$  (**BFTE Table 1**). If the Committee were to continue the past practice of assuming three different constant recruitment levels, under the medium and low scenarios the stock is already above  $B_{0.1}$ , whereas for the high level it is below.

The updated indices of abundance were consistent with the projections for 2016.

#### BFTE-5. Effect of current regulations

The 2011, 2012, and 2013 TACs were set at 12,900 t, 12,900 t, and 13,400 t respectively by Rec. 10-04 and Rec. 12-03, at 13,400 t in 2014 (Rec. 13-07), 16,142 t in 2015 (Rec. 14-04), 19,296 t in 2016 (Rec. 14-04) and 23, 655 t in 2017 (Rec. 14-04 and Rec. 16-09). Nevertheless, the reported catch in 2016 exceeded the TAC.

The Committee agreed that a substantial decrease in the catch occurred in the eastern Atlantic and Mediterranean Sea through implementation of the rebuilding plan and through monitoring and enforcement controls.

2017 analyses from the reported catch-at-size and catch-at-age displayed substantial changes in selectivity patterns towards larger fish over the last years for several fleets operating in the Mediterranean Sea or the East Atlantic, partly resulting from the enforcement of minimum size regulations under Rec. 06-05. This also resulted in improved yield-per-recruit levels due to higher survival of juvenile fish in comparison to the early 2000s, meaning that the stock can produce larger yield at any given level of SSB.

An important source of uncertainty originated from the reduction in TAC and size limits which may have caused changes in the fishing strategy that has strongly affected all the index calculations .It is also worth noting that the transfer of quotas from one fisheries to another may also affect stock assessment outcomes, as such transfers have implications for the repartition of the fishing effort and thus for selectivity patterns, which are known to impact the references points. Therefore, the Committee reiterates the importance to continue effort, through national programmes and GBYP, to improve the quality of currently used abundance indices and obtain robust fisheries-independent indicators. It notes however that necessary decisions regarding management of the stock have often the side effect of adding uncertainties to stock assessment, e.g., by changing fleet behaviour and fisheries selection pattern.

<sup>1</sup> Averages taken over the years 1968-1980/1968-2012/1990-2005, for the low medium and high scenarios respectively.

The combination of size limits and the reduction of catch has certainly contributed to a rapid increase of the abundance of the stock.

## BFTE-6. Management recommendations

The projections generated from the base VPA suggest that catches up to 38,000 t or 36,000 t have a greater than a 60% probability of maintaining F below  $F_{0.1}$  in 2020 or 2022 respectively (**BFTE Table 1**). They also indicate that catches of 28,000 t or less have a higher than 50% probability of allowing a continue increase in the stock (**BFTE Figure 5**). It should be kept in mind, however, that the Kobe matrix cannot integrate some important sources of uncertainties that currently remain unquantified as mentioned in section BFTE-4 and in the Report of the 2017 ICCAT Atlantic bluefin tuna stock assessment session. Several sensitivity runs of the VPA and preliminary results of other assessment models suggest catches at  $F_{0.1}$  that are notably lower than given by the base VPA. This points to the need to be cautious.

A case could be made to base TAC advice on the Kobe matrix results for either 2020 or 2022. However, if the TAC is set at 38,000 t through 2020, then it may have to be reduced below 36,000 t in 2021 and 2022 to maintain at least a 60% probability of not overfishing. Given the uncertainties discussed above, use of the catch figure of 36 000 t is advised due to the rebuilding time frame set to 2022. For these same reasons the Committee advises that the catches be increased using a gradual stepwise approach to 36,000 t in 2020. The continuation of the stepped increases should be reviewed annually by the Commission on the advice of the SCRS (which would be based on updates of the fishery indicators as has been done in the past three years, i.e., the SCRS could, on any of those occasions, recommend that the next increase not occur given sufficiently negative indicator signals). The Committee recommends a full assessment in 2020.

Given the abundance increase evident for the stock, the Committee advises that the Commission should consider moving from the current rebuilding plan to a management plan.

EAST ATLANTIC AND MEDITER	RANEAN BLUEFIN TUNA SUMMARY
Current reported yield (2016)	20,098 t*
F <sub>0.1</sub>	0.107(0.103-0.120)1
$F_{2012-2014}/F_{0.1^2}$	0.339 (0.254-0.438)1
Stock Status	Overfishing: No
Projected Yield <sup>3</sup> at F <sub>0.1</sub> in 2018	41,205 (31,190 – 57,770) t
Projected Yield <sup>3</sup> at F <sub>0.1</sub> in 2019	40,455 (31,330 – 56,600) t
Projected Yield <sup>3</sup> at F <sub>0.1</sub> in 2020	39,655 (30,420 – 55,280) t
[Rec. 12-03] TAC in 2013-2014	13,400 t – 13,400 t
[Rec. 14-04] TAC in 2015-2017	16,142 t – 19,296 t – 23,155 t
[Rec. 16-09] TAC in 2017	+500 t

1 Median and approximate 80% confidence interval from bootstrapping from the assessment.

 $2\;F_{2012\text{-}2014}$  refers to the geometric mean of the estimates for 2012-2014 (a proxy for recent F levels).

3 Projected yield at  $F_{0.1}$  was calculated with the recent 6 years (2006-2011) recruitment level.

\* As of 29 September 2017.

**BFT-Figure 1**. Geographic distribution of bluefin tuna catches per 5x5 degrees and per main gears from 1960 to 2015 (last decade only covers 6 years).

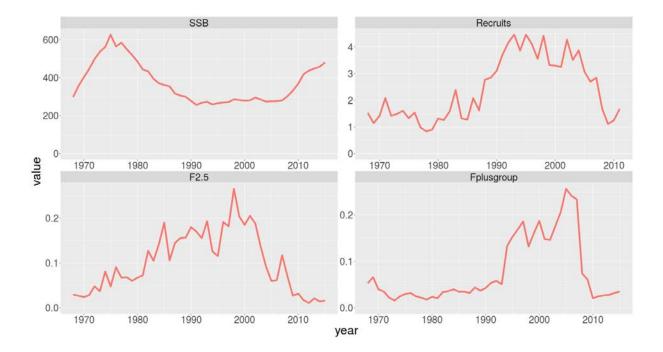

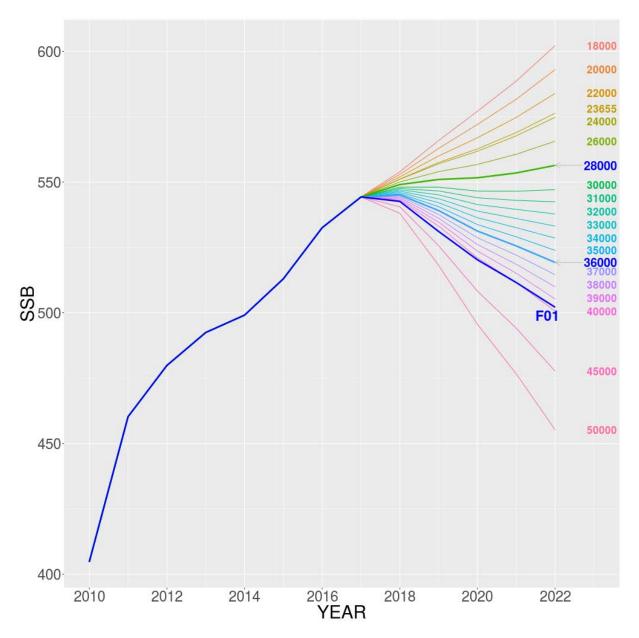

**BFTE-Figure 2.** Reported catch for the East Atlantic and Mediterranean from Task I data from 1950 to 2016 split by main geographic areas (top panel) and by gears (bottom panel) together with unreported catch estimated by the SCRS (grey shading, using fishing capacity information and mean catch rates over the last decade) from 1998 to 2007 (the SCRS did not detect unreported catch using fishing capacity information since 2008) and TAC levels since 1998.

**BFTE-Figure 3.** Plots of the updated fishery dependent and independent indicators which used for the 2017 stock assessment for the East Atlantic and Mediterranean bluefin tuna stock. All indicators are standardized series and scaled to their averages. The Spanish BB series was split in two series to account for changes in selectivity patterns, and the latest series was calculated using French BB data due to the sale of the quota by the Spanish fleet. The Japanese Longlines CPUE for the Northeast Atlantic has been updated until 2017, and it was split in 2009/2010. Because the Moroccan-Spanish traps CPUE was not be able to be updated, the Moroccan-Portuguese traps CPUE was developed and used for the first time. Two fishery independent indicators were also used for the first time: French aerial and Western Mediterranean larval survey.

**BFTE-Figure 4.** Spawning stock biomass (in thousand metric ton), recruitment (in million), and fishing mortality (average over ages 2 to 5, and 10+) estimates from VPA base run from the 2017 stock assessment for the period between 1968 and 2015. The last four years recruitments (2012-2015) are not shown because they are poorly estimated.

**BFTE-Figure 5.** Median trends in the 2017 projections of spawning stock biomass (in 1000 metric t) up to 2022 under the recent 6 years (2006-2011) recruitment scenario with various levels of constant catch starting in 2018, assuming TAC is caught in 2016 and 2017. The TAC values for 2016 (19,296 t) and 2017 (23,655 t) were also used for the projection.

### **BLUEFIN TUNA - WEST**

### BFTW-2. Fishery indicators

The total catch for the West Atlantic peaked at 18,608 t in 1964, mostly due to the Japanese longline fishery for large fish off Brazil (that started in 1962) and the U.S. purse seine fishery for juvenile fish (**BFT Table 1**, **BFTW Figure 1**). Catches dropped sharply thereafter to slightly above 3,000 t in 1969 with the collapse of the bluefin tuna by-catch longline fishery off Brazil in 1967 and declines in purse seine catches. Catches increased again to average over 5,000 t in the 1970s due to the expansion of the Japanese longline fleet into the northwest Atlantic and Gulf of Mexico and an increase in purse seine effort targeting larger fish for the sashimi market. Catches declined abruptly in 1982 from close to 6,000 t in the late 1970s early 1980s with the imposition of a quota. The total catch for the West Atlantic, including discards, fluctuated without trend after 1982 reaching 3,319 t in 2002 (the highest since 1981, with all three major fishing nations indicating higher catches). Total catch in the West Atlantic subsequently declined steadily to 1,638 t in 2007 and then fluctuated without pronounced trend. The catch in 2014 was 1,626 t, 1,842 in 2015 and 1,899 in 2016 (**BFTW Figure 1**). The decline through 2007 was primarily due to considerable reductions in the catch in U.S. fisheries.

The Data Preparatory meeting, held in March 2017, decided to use 10 CPUE and two survey indices including a new Gulf of St. Lawrence acoustic survey. The two traditional Canadian CPUE indices for the Gulf of St Lawrence and Southwest Nova Scotia were replaced with a combined index for the two areas. Indices were updated to 2016 (**BFTW Figure 2**) (and 2017 for the Japanese longline). All updated indices increased in 2016 compared to 2015, some modestly (US RR 66-114cm, US RR >177 and GOM US LL) and others with more pronounced increases (US RR 115-144, JLL, the larval index and the Canadian RR combined). The 2017 index for JLL is slightly lower than 2016.

# BFTW-3. State of the stock

The SCRS continues to caution that the conclusions from the latest assessment (2017), using data through 2015, do not capture the full degree of uncertainty in the assessments and projections. The various major contributing factors to these uncertainties include mixing between the stocks, recruitment, age composition, age at maturity, and indices of abundance.

Four stock assessment models were explored for the 2017 western bluefin tuna stock assessment: virtual population analysis (VPA), Stock Synthesis (SS), Age Structured Assessment Programme (ASAP), and Statistical Catch-at-length (SCAL). However, only the results of the former two were considered sufficiently developed to provide advice on stock status. Major revisions to the input data were incorporated into the 2017 stock assessment as agreed at the 2017 Data Preparatory meeting (SCRS Data Preparatory Report). Revisions/decisions used across all assessment models include revised natural mortality, growth, two spawning-at-age scenarios, revised total and fleet specific catch-at age (based on new Task I and Task II data and growth), Canadian CPUE indices combined into a single index, Canadian acoustic survey included in the assessment inputs, and the Japanese longline index split into two time series.

All models demonstrated a generally consistent trend in relative abundance during overlapping time periods, however the absolute biomass varied depending upon the model.

Previous stock assessments determined stock status based on MSY-related reference points using two alternative recruitment potential scenarios: a 'low recruitment' scenario and a 'high recruitment' scenario. The 2017 assessments do not provide management advice based on MSY reference points. Instead, the focus is on giving short-term advice based on F reference point ( $F_{0.1}$ ), a proxy for  $F_{MSY}$ , using recent recruitment assuming that near term recruitment will be similar to the recent past recruitment.

In addition to the revisions identified above that are common to all models, the starting year for the VPA input was advanced from 1970 in the 2014 assessment to 1974 in the 2017 assessment, due to limited size composition data before 1974. This has had major implications on fitting the stock recruitment relationship because there is no longer sufficient contrast in stock biomass. The Canadian combined RR and the US RR>177 indices were removed from the VPA model because they indicated opposing trends and were believed to be most sensitive to the hypothesis of shifting spatial distribution of fish. The

conflicting signals in these and other indicators could be a function of changing oceanographic conditions, as considered in the Stock Synthesis models. VPA runs were made for two spawning fraction scenarios (a young age at spawning, consistent with the eastern stock and older age of spawning with 100% spawning contribution at age 15). Rather than presenting two series of spawning stock biomass (SSB) based on these two spawning fraction scenarios, total biomass is presented here instead.

The total stock biomass estimated by VPA decreased sharply between 1974 and 1981, followed by more than two decades of stability (at about 50% of the 1974 biomass) across the turn of the century, and then by a gradual increase since 2004 to 69% of the 1974 biomass in 2015. Recruitment was high in the early 1970s, but subsequently fluctuated around a lower average until 2003 when there was a strong year class. Recruitment has shown a downward trend since.

Using  $F_{0.1}$  as a proxy for  $F_{MSY}$ , current F estimated from the VPA relative to the  $F_{0.1}$  reference point was 0.72, indicating that overfishing is not occurring.

The base Stock Synthesis (SS) model was fit to the agreed eleven indices and for the young age and older age spawning scenarios. Differences from the VPA included the extended time series going back to 1950, incorporation of length and age composition information and estimation of growth parameters. The SS model also considered a hypothesis that the divergent patterns between the Canadian GSL-SWNS and GSL-Acoustic indices and the US RR>177 index were due to changes in availability of fish due to variable oceanographic conditions. This was done by directly incorporating the Atlantic Multidecadal Oscillation (AMO), an index of cyclical sea surface temperature, into the model to reconcile the conflicting signals from these indices.

SS gives a longer time series view of the population, capturing the higher recruitments estimated in the 1960s. In the recent time period, mean recruitment is similar to the VPA but the magnitude of the 1994 and 2003 year classes are estimated to be larger, resulting in lower fishing mortality and higher total biomass than in the VPA (**Figures BFTW 3** and **BFTW 4**). Total biomass in 2015 was 18% of biomass in 1950 and 45% of biomass in 1974.

Under an  $F_{0.1}$  strategy for the younger and older spawning fraction scenarios  $F_{current}/F_{0.1}$  was 0.56 for both scenarios indicating that overfishing is not occurring for this stock.

In 2017, the Committee explored the implications of stock mixing using two approaches. The first approach revised the catches and stock size indices of eastern and western fisheries to eastern and western populations-of-origin based on time varying stock composition estimates. VPA models were then applied to the revised data for western-origin fish and eastern-origin fish separately. Trends in stock size and fishing mortality from the population-of-origin VPAs were generally similar to those of the original VPAs of mixed stocks, but the western VPA was more sensitive to stock mixing than the eastern VPA.

The second approach used a mixed VPA that assumed that the proportion of the stocks that move from one area to the other is constant in time and space. The trends for the western stock were similar in the stock of origin VPA to the runs without mixing; however, the mixed VPA indicated that some of the recent increase in biomass in the West Atlantic may be attributed to immigration of eastern origin fish.

Biomass estimates were more sensitive to stock composition data than to conventional tagging data. However, both data sets have limited spatial and temporal coverage and do not represent random samples of the overall population. The Committee noted that further work is needed to validate the methods and collect more representative data before these approaches can be used for quantitative scientific advice.

### Summary

Two stock assessment platforms (VPA and SS) were considered sufficiently advanced at the conclusion of the assessment meeting to be considered as the basis for management advice for the western stock. Two other models (ASAP and SCAL), as well as the mixing analyses provided useful insights. Both VPA and SS showed good fits to the data and stable model performance. Those results were equally weighted to formulate advice. Both models estimated with a high probability that overfishing is not occurring. The SS biomass estimates suggest that historical biomasses were considerably higher than current ones (**BFTW Figure 4**).

As indicated above, management advice is not based on MSY reference points because of continued uncertainty about spawning biomass and recruitment potential. Instead it is based on fishing mortality reference points to project short term yield based on recent recruitment as opposed to a stock recruitment assumption.  $F_{0.1}$  was considered a reasonable proxy for  $F_{MSY}$ , although it can be higher or lower than  $F_{MSY}$  depending on the stock recruitment relationship, which in this case is poorly determined.

# BFTW-4. Outlook

The current fishing mortality (F=0.05) is below the  $F_{0.1}$  reference point ( $F_{0.1}$ = 0.09).  $F_{current}/F_{0.1}$  for the combined VPA and SS results is 0.59.

The 2017 short term-projections (2018-2020) were based on the average recruitment during 2007-2012 for both the VPA and the SS models. Fishing at  $F_{0.1}$  in 2018 to 2020 implies increased catches in 2018 (2,691 t) followed by decreases in 2019 (2,568 t) and 2020 (2,446 t). The decreases in biomass are predicted due to the 2003 year-class having passed its peak biomass and below average recruitment in recent years. The expected changes in biomass under constant catch scenarios and one constant  $F_{0.1}$  scenario are shown in **BFTW Table 3** and **BFTW Figure 5**. It should be noted that biomass is expected to decline for catches greater than 1,000 t.

The Committee reiterates that the effects of mixing and management measures on the eastern stock remains a considerable source of uncertainty for the outlook of the western stock.

# BFTW-5. Effect of current regulations

The Committee noted that Recommendations 08-04, 10-03, 12-02 and 14-05 were expected to result in a rebuilding of the stock towards the Convention objective. The 2017 assessment estimated that the biomass has increased during 2004 to 2015. As biomass based reference points are not used in formulating 2017 advice, the Committee did not evaluate if the rebuilding objectives were met.

#### BFTW-6. Management recommendations

In 1998, the Commission initiated a 20-year rebuilding plan designed to achieve SSB<sub>MSY</sub> with at least 50% probability. In response to recent assessments, the Commission recommended a total allowable catch (TAC) of 1,900 t in 2009, 1,800 t in 2010 (Rec. 08-04), 1,750 t in 2011, 2012, 2013 and 2014 (Rec. 10-03, Rec. 12-02, Rec. 13-09) and 2,000 t in 2015 to 2017 (Rec. 14-05, Rec 16-08). As indicated above, the Committee is not using biomass based reference points in formulating 2017 advice. Instead,  $F_{0.1}$  is used as a proxy for  $F_{MSY}$  to provide the TAC recommendations.

The 2017 assessment indicated similar historical trends in abundance as in previous assessments, with a general increase in recent years (since 2004). The strong 2003 year class and recent reduction in fishing mortality have contributed to this increase in recent years. However, the 2003 year-class is past its peak biomass, recruitment has been declining for a number of years and there are no signs of a strong year class coming into the fishery.

The Committee is not evaluating if the stock is rebuilt because it has been unable to resolve the long term recruitment potential. If an  $F_{0.1}$  strategy were to continue to be applied, over the longer term the resource would fluctuate around the true, but unknown value of  $B_{0.1}$  whatever the future recruitment level. The  $F_{0.1}$  strategy compensates for the effect of recruitment changes on biomass by allowing higher catches when recent recruitment is higher, and reducing catches when recent recruitments are lower. Under this strategy, biomass may decrease at times because the stock is above B0.1 or following lower recruitments.

The Committee advises that constant catches over 2018-2020 should not be greater than 2500 t as that would exceed the median yield associated with  $F_{0.1}$ . The probability of avoiding overfishing (F<F<sub>0.1</sub>) associated with various constant catch strategies are shown in **BFTW Table 2**. The Committee notes that nearly all constant catch options shown (i.e., greater than 1,000 t) will result in an estimated decrease in biomass between 2018 and 2020; the percentage decrease being larger for the larger catches (**BFTW Table 3**).

**Summary Table.** Estimated recent fishing mortality rate (geometric mean of apical F for the period 2012 to 2014) relative to the F reference point,  $F_{0.1}$  (a proxy for  $F_{MSY}$  based on recent recruitment estimates for the period 2007 to 2012). An 80% confidence interval of estimated Fs and projected catches are shown in parentheses.

SUM	MARY TABLE

**BFTW-Table 2.** Kobe II matrix giving the probability that the fishing mortality rate (F) will be less than the F reference point ( $F \le F_{0.1}$ , overfishing not occurring) over the next 3 years for alternative constant catches, based on results from VPA and SS combined.

**BFTW-Table 3.** Relative change in total stock biomass relative to 2017 under alternative constant catch scenarios.

**BFTW-Figure 1**. Historical catches of western bluefin tuna: (a) by gear type and (b) in comparison to TAC levels agreed by the Commission.

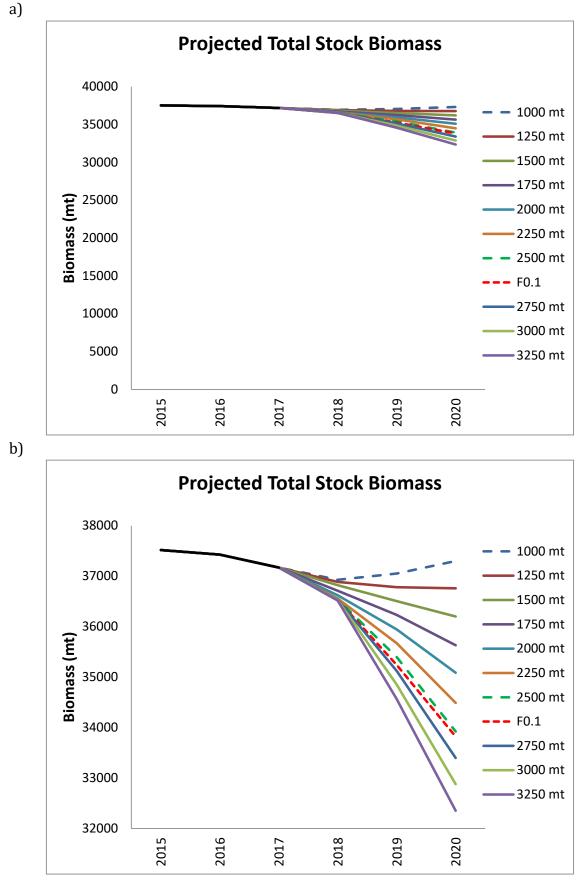

BFTW-Figure 2. Indices of relative abundance for western bluefin tuna.

**BFTW-Figure 3.** Estimated fishing mortality relative to the  $F_{0.1}$  reference point estimated by VPA (red) and SS (blue). The 80% confidence intervals are indicated with dashed lines.

**BFTW-Figure 4.** Median estimates of recruitment and total stock biomass for the base VPA (red) and SS (blue) models. The 80% confidence intervals are indicated with dashed lines. The recruitment estimates for the last three years of the VPA are considered unreliable and have been replaced by the average estimates from 2007 to 2012.

**BFTW-Figure 5.** Projected total stock biomass under alternative constant catch scenarios and a constant F scenario ( $F=F_{0.1}$ ) for the base VPA and SS model results combined; a) showing full range on y-axis, and b) y-axis shown from 32,000 to 38,000 t.

### 8.6 BUM – BLUE MARLIN

The most recent assessment for blue marlin was conducted in 2011 through a process that included a data preparatory meeting in May 2010 and an assessment meeting in April 2011 The last year of fishery data used in the assessment was 2009.

# BUM-1. Biology

The central and northern Caribbean Sea and northern Bahamas have historically been known as the primary spawning area for blue marlin in the western North Atlantic. Recent reports show that blue marlin spawning can also occur north of the Bahamas in an offshore area near Bermuda at about 32°-34° N. Ovaries of female blue marlin caught by artisanal vessel in Côte d'Ivoire show evidence of pre-spawning and post-spawning, but not of spawning. In this area females are more abundant than males (4:1 female/male ratio). Coastal areas off West Africa have strong seasonal upwelling, and may be feeding areas for blue marlin.

Atlantic blue marlin inhabit the upper parts of the open ocean. Blue marlin spend the majority of their time in the mixed surface layer (58% of daylight and 84% of nighttime hours), however, they regularly make short-duration dives to maximum depths of around 300 m, with some vertical excursions down to 800 m. They do not confine themselves to a narrow range of temperatures but most tend to be found in waters warmer than 17°C. The distribution of time at depth is significantly different between day and night. At night, the fish spent most of their time at or very close to the surface. During daylight hours, they are typically below the surface, often at 40 to 100+ m. These patterns, however, can be highly variable between individuals and also vary depending on the temperature and dissolved oxygen of the surface mixed layer. This variability in the use of habitat by blue marlin indicates that simplistic assumptions about habitat usage made during the standardization of CPUE data may be inappropriate.

### BUM-2. Fishery indicators

The decadal geographic distribution of the catches is given in **BUM-Figure 1**. The Committee used Task I catches as the basis for the estimation of total removals (**BUM-Figure 2**). Total removals for the period 1990-2009 were obtained during the 2011 Blue Marlin Stock Assessment and the White Marlin Data Preparatory Meeting by modifying Task I values with the addition of blue marlin that the Committee estimated from catches reported as billfish unclassified. Additionally the reporting gaps were filled with estimated values for some fleets.

During the 2011 blue marlin assessment it was noted that catches continued to decline through 2009. Over the last 20 years, Antillean artisanal fleets have increased the use of Moored Fish Aggregating Devices (MFADs) to capture pelagic fish. Catches of blue marlin caught around MFADs are known to be significant and increasing in some areas, however reports to ICCAT on these catches are incomplete. Although historical catches from some Antillean artisanal fleets have been recently included in Task I there still an unknown number of Antillean artisanal fleets that may have unreported catches of blue marlin caught around MFADs. It is important that the amount of these catches be documented. Recent reports from purse seine fleets in West Africa suggest that blue marlin is more commonly caught with tuna schools associated with FADs than with free tuna schools. Preliminary Task I catches of blue marlin (**BUM-Table 1**) in 2016 were 1,295 t, compared to 1,569 t reported for 2015. Due to the work conducted by the Committee and improved reporting by CPCs the amount of unclassified billfish in the Task I table has been reduced.

A number of relative abundance indices were estimated during the blue marlin 2011 assessment. However, given the apparent shift in landings from industrial to non-industrial fleets in recent times, it is imperative that CPUE indices are developed for all fleets that have substantial landings.

During the 2011 assessment, an estimated standardized combined CPUE index for blue marlin showed a sharp decline during the period 1960-1975, followed by a period of stabilization from about 1976 to 1995, and further decline thereafter to the lowest value in the series (**BUM-Figure 3**).

### BUM-3. State of the stocks

Unlike the partial assessment of 2006, the Committee conducted a full assessment in 2011, which included estimations of management benchmarks. The results of the 2011 assessment indicated that the stock remains overfished and undergoing overfishing (**BUM-Figure 4**). In contrast to the results of the 2006 assessment, which indicate that, the declining trend in biomass had partially stabilized, current results indicated a continued decline trend. Current status of the blue marlin stock is presented in **BUM Figure 5**. However, the Committee recognizes the high uncertainty with regard to data and the productivity of the stock.

### BUM-4. Outlook

Although uncertain, the results of the 2011 stock assessment indicated that if the recent catch levels of blue marlin (3,358 t in 2010, as in the time of the stock assessment) are not substantially reduced, the stock will continue to decline further (**BUM-Figure 6**; **BUM-Table 2**). The current management plan has the potential of recovering the blue marlin stock to the  $B_{MSY}$  level if properly conducted.

# BUM-5. Effect of current regulations

A 2006 recommendation (Rec. 06-09) established that the annual amount harvested by pelagic longline and purse seine vessels and retained for landing must be no more than 33% for white marlin and 50% for blue marlin of the 1996 or 1999 landing levels, whichever is greater. Furthermore, in 2012, the Commission established a TAC for 2013, 2014, and 2015 of 2,000 t (Rec. 12-04), placed additional catch and commerce restrictions in recreational fisheries for blue marlin and white marlin, and requested methods for estimating live and dead discards of blue marlin and white marlin/spearfish. In 2015, the Commission further strengthened the plan to rebuild blue marlin stock by extending for 2016, 2017, and 2018 the annual limit of 2,000 t for blue marlin [Rec. 15-05].

The Committee is concerned with the significant increase in the contribution from non-industrial fisheries to the total blue marlin harvest and that these fisheries are not fully accounted for in the current ICCAT database. The Committee expressed its serious concern over this limitation on data for future assessments. Such data limitation precludes any analysis of the current regulations.

Currently, four ICCAT Contracting Parties (Brazil, Canada, Mexico, and the United States) mandate or encourage the use of circle hooks on their pelagic longline fleets. Recent research has demonstrated that in some longline fisheries the use of non-offset circle hooks resulted in a reduction of billfish mortality, while the catch rates of several of the target species remained the same or were greater than the catch rates observed with the use of conventional J hooks or offset circle hooks.

More countries have started reporting data on live releases since 2006. Additional information has come about, for some fleets, regarding the potential for modifying gears to reduce the by-catch and increase the survival of marlins. Such studies have also provided information on the rates of live releases for those fleets. However there is not enough information on the proportion of fish being released alive for all fleets, to evaluate the effectiveness of the ICCAT recommendation relating to the live release of marlins.

### BUM-6. Management recommendations

In 2012, the Commission implemented Rec. 12-04, intended to reduce the total harvest to 2,000 t in 2013, 2014, and 2015 to allow the rebuilding of the blue marlin stock from the overfished condition. In 2015, the Commission extended the 2,000 t annual catch limit to 2016, 2017, and 2018 [Rec. 15-05]. The Committee expressed its concern on the effectiveness of such measure in light of severe under reporting currently occurring in some fisheries. Therefore, the Committee alerts the Commission that unless such non-compliance issues are properly addressed the adoption of additional measures might be rendered ineffective.

# ATLANTIC BLUE MARLIN SUMMARY

Maximum Sustainable Yield	2,837 t (2,343 – 3,331 t) <sup>1</sup>
Current (2016) Yield	1,295 t <sup>2</sup>
Relative Biomass (SSB2009/SSB <sub>MSY</sub> )	0.67 (0.53 - 0.81)1
Relative Fishing Mortality (F <sub>2009</sub> /F <sub>MSY</sub> )	1.63 (1.11 – 2.16) <sup>1</sup>
Stock Status (2009)	Overfished: Yes
	Overfishing: Yes
Conservation and Management Measures in Effect:	Recommendation [Rec. 15-05]. Reduce the total harvest to 2,000 t in 2016, 2017, and 2018.

Stock Synthesis version 3.2.0.b model results. Values correspond to median estimates, 95% confidence interval values are provided in parenthesis.
 2016 yield should be considered provisional.

**BUM-Figure 1.** Geographic distribution of blue marlin total catches by decade (last decade only covers 6 years).

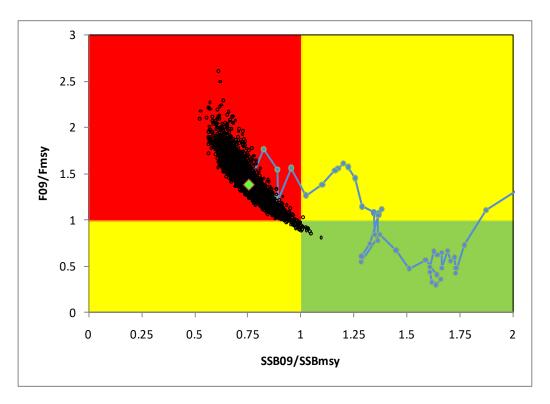

**BUM-Figure 2.** Total catch of blue marlin reported in Task I for the period 1956-2016.

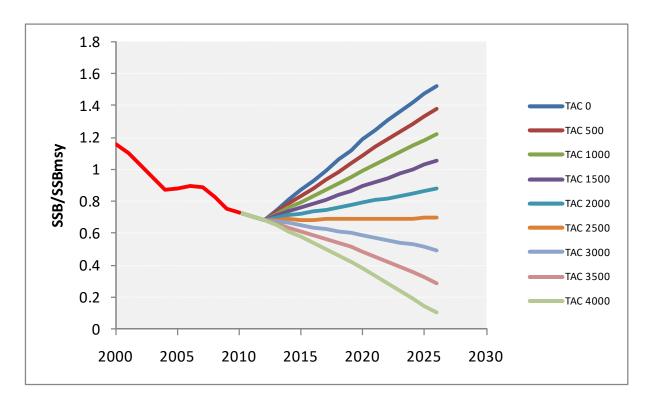

**BUM-Figure 3.** Blue marlin standardized combined CPUE indices estimated using equal weighting for all CPUE series (EQW), weighting the CPUE series by area (ARW) and by catch (CAW).

**BUM-Figure 4.** Trends of  $F/F_{MSY}$  and  $SSB/SSB_{MSY}$  ratios for blue marlin from the base model (SS3). Solid lines represent median from MCMC runs, and broken lines the 10% and 90% percentiles, respectively.

**BUM-Figure 5.** Phase plot for blue marlin from the base model in final year model assessment (2009). Individual points represent MCMC iterations, large diamond the median of the series. Blue circles with line represent the historic trend of the median F/F<sub>MSY</sub> vs. SSB/SSB<sub>MSY</sub> 1965-2008.

**BUM-Figure 6.** Trends of SSB/SSB<sub>MSY</sub> ratios under different scenarios of constant catch projections (TAC tons) for blue marlin from the base model. Projections start in 2010; for 2010/11 a catch of 3,341 t was assumed.

# 8.7 WHM – WHITE MARLIN

The most recent assessment for white marlin was conducted in 2012 through a process that included a data preparatory meeting in April 2011 and an assessment meeting held in May 2012. The last year of fishery data used in the assessment was 2010.

# WHM-1. Biology

White marlin spawning areas occur mainly in the tropical western North and South Atlantic, predominantly in the same offshore locations in their normal range. In the North Atlantic, spawning activity has been reported off eastern Florida (USA), the Windward Passage (between La Hispaniola and Cuba), and north of Puerto Rico. Seasonal spawning concentrations have been noted northeast of Hispaniola and Puerto Rico, and off the east coast of Hispaniola. Spawning activity has also been reported for the equatorial Atlantic (5°N-5°S) off northeastern Brazil, and in the South Atlantic off southern Brazil.

Previous reports have mentioned that spawning takes place during austral and boreal spring-summer. In the North Atlantic, reproduction events occur from April to July, with spawning activity peaking around April-May. In the equatorial Atlantic (5°N-5°S), spawning occurs during May to June, and in the South Atlantic, reproduction events take place from December to March.

White marlin inhabits the surface mixed layer of the open ocean. Although they spend about 50% of daylight hours and 81% of nighttime hours in the warmer waters of the mixed surface layer, they do explore temperatures ranging 7.8-29.6°C. However, a negligible amount of time is spent at temperatures less than 7 °C below the mixed surface layer. Information from pop-up satellite archival tag (PSAT) data indicated frequent short-duration dives extending to >300 m depths, although most dives ranged from 100 to 200 m. Two types of diving behavior have been identified for white marlin, (1) a shorter duration V-shaped dive, and (2) a U-shaped dive characterized as those confined to a specific depth range for a prolonged period. These patterns, however, can be highly variable between individuals and also vary depending on the temperature and dissolved oxygen of the surface mixed layer. Therefore, it is important to consider vertical habitat use and the environmental factors that influence it during the standardization of CPUE data.

All white marlin biological material sampled prior to the confirmation of the presence of roundscale spearfish (*T. georgii*) in 2006, are now presumed to contain an unknown proportion of roundscale spearfish. Therefore reproductive parameters, growth curves and other biological studies previously thought to describe white marlin may not accurately represent this species.

### WHM-2. Fishery indicators

It has now been confirmed that white marlin landings reported to ICCAT include roundscale spearfish in significant numbers, so that historical statistics of white marlin most likely comprise a mixture of the two species. Studies of white marlin/roundscale spearfish ratios in the western Atlantic have been conducted, with overall estimated ratios between 23-27%, although they varied in time and space. Previously, these were thought to represent only white marlin. However, there is little information on these species ratios in the eastern Atlantic.

The decadal geographic distribution of the catches is given in **WHM-Figure 1**. The Committee used Task I catches as the basis for the estimation of total removals (**WHM-Figure 2**). Total removals for the period 1990-2010 were obtained during the 2012 White Marlin Stock Assessment Session by modifying Task I values with the addition of white marlin that the Committee estimated from catches reported as billfish unclassified.

Additionally the reporting gaps for some fleets were completed using estimates based on catch values reported for years before and/or after the gap(s) years.

Preliminary Task I catches of white marlin (**WHM-Table 1**) in 2016 were 452 t, compared to 457 t reported for 2015. Landings for 2016 do not include the reports. Due to the work conducted by the Committee and improved reporting by CPCs the amount of unclassified billfish in the Task I table has been minimized.

A series of indices of abundance for white marlin were presented and discussed during the 2011 and 2012 meetings. Following the guidelines developed by the SCRS Working Group on Stock Assessment Methods (WGSAM), seven CPUE series were selected for their inclusion in the assessment models. In general, the indices showed no discerning trend during the latter part of the time series examined (**WHM-Figure 3**). During the 2012 assessment, an estimated standardized combined CPUE index for white marlin showed a sharp decline during the period 1960-1991, and a relatively stable trend thereafter (**WHM-Figure 3**).

# WHM-3. State of the stock

Unlike the partial assessment conducted in 2006, the Committee conducted a full assessment in 2012, which included estimations of management benchmarks. Two models were used to estimate the status of the stock, a surplus production model (ASPIC), and a fully integrated model (SS3). The methods used for the fully integrated model followed very closely those used in the 2011 blue marlin assessment. As recommended by the working group in 2010, the model configuration was an effort to use all available data on white marlin, including lengths, dimorphic growth patterns and other biological data. Although it is believed that the modeling methods employed were relatively robust, the input data for the models were very likely less so. Perhaps the most important uncertainty was that associated with the landings data. There remains uncertainty not only in the species composition but also the magnitude of the catch. This is especially a problem with the landings data starting in 2002 when CPCs were mandated to release billfish that were alive at haulback. This led to a decrease in reported landings but not necessarily a decrease in fishing and/or release mortality. This apparent drop in landings led to a marked decrease in the estimates of F/F<sub>MSY</sub> from 2002-present, however the Committee considers that this trend is likely overly optimistic due to unreported catch and unaccounted release mortality.

The results of the 2012 assessment indicated that the stock remains overfished but most likely not undergoing overfishing (**WHM-Figure 4**, **Figure 5**). Relative fishing mortality has been declining over the last ten years and is now most likely to be below  $F_{MSY}$  (**WHM-Figure 6**). Relative biomass has probably stopped declining over the last ten years, but still remains well below  $B_{MSY}$  (**WHM-Figure 6**). There is considerable uncertainty in these results. The two assessment models provide different estimates about the productivity of the stock, with the integrated model suggesting that white marlin is a stock that can rebuild relatively fast whereas the surplus production model suggests the stock will rebuild very slowly. The results from both approaches are considered to be equally plausible. These results are conditional on the reported catch being a true reflection of the fishing mortality experienced by white marlin. Sensitivity analyses suggest that if recent fishing mortality has been greater than reported, because discards are not reported by many fleets, estimates of stock status would be more pessimistic and current relative biomass would be lower and overfishing would continue. The presence of unknown quantities of roundscale spearfish in the reported catches and data used to estimate relative abundance of white marlin increases the uncertainty for the stock status and outlook for this species.

# WHM-4. Outlook

The outlook for this stock remains uncertain because of the possibility that reported catches underestimate fishing mortality and the lack of certainty in the productivity of the stock. As a result, forecasts of how the stock will respond to different levels of catch are uncertain (**WHM-Table 2**). At current catch levels of about 400 t the stock will likely increase in size, but is very unlikely to rebuild to  $B_{MSY}$  in the next ten year period (**WHM-Table 2**). Fishing mortality is highly likely to remain below  $F_{MSY}$ . The speed at which the stock biomass may increase and the time necessary to rebuild the stock to  $B_{MSY}$  remains highly uncertain. This will depend on whether current reported catches are true estimates of fishing mortality, and on the true productivity of the white marlin stock.

# WHM-5. Effect of current regulations

A 2006 recommendation (Rec. 06-09) established that the annual amount harvested by pelagic longline and purse seine vessels and retained for landing must be no more than 33% for white marlin and 50% for blue marlin of the 1996 or 1999 landing levels, whichever is greater. Furthermore, in 2012, the Commission established a TAC for 2013, 2014, and 2015 of 400 t (Rec. 12-04), placed additional catch and commerce restrictions in recreational fisheries for blue marlin and white marlin, and requested methods for estimating live and dead discards of blue marlin and white marlin/spearfish. In 2015, the Commission further strengthened the plan to rebuild white marlin stock by extending for 2016, 2017, and 2018 the annual limit of 400 t for white marlin/spearfish (Rec. 15-05).

The Committee is concerned with the significant increase in the contribution from non-industrial fisheries to the total white marlin harvest and that these fisheries are not fully accounted for in the current ICCAT database. The Committee expressed its serious concern over this limitation on data for future assessments. Such data limitation precludes any analysis of the current regulations. In addition the Committee expressed concern of the status of white marlin due to the misidentification of spearfishes in the white marlin catches. This situation adds uncertainty to the stock assessment results.

Currently, four ICCAT Contracting Parties (Brazil, Canada, Mexico, and the United States) mandate or encourage the use of circle hooks on their pelagic longline fleets. Recent research has demonstrated that in some longline fisheries the use of non-offset circle hooks resulted in a reduction of billfish mortality, while the catch rates of several of the target species remained the same or were greater than the catch rates observed with the use of conventional J hooks or offset circle hooks.

The Committee noted that more countries have started reporting data on live releases in 2006. However, there is not enough information on the proportion of fish being released alive to evaluate the effectiveness of the ICCAT recommendation, relating to the live release of white marlin.

### WHM-6. Management recommendations

In 2012, the Commission implemented Rec. 12-04, intended to reduce the total harvest to 400 t in 2013, 2014, and 2015 to allow the rebuilding of the white marlin stock from the overfished condition. In 2015, the Commission extended the 400 t annual catch limit to 2016, 2017, and 2018 (Rec. 15-05). The Committee expressed its concern on the effectiveness of such measure in light of the misidentification of spearfishes in the white marlin catches, which causes uncertainty in stock assessment results and enforcement related problems. The Committee notes that if catches exceed the TAC, as was the case for 2015 and 2016, the rebuilding of the stock will proceed more slowly.

# ATLANTIC WHITE MARLIN SUMMARY

Conservation and Management	Recommendation [Rec. 15-05]
Stock Status (2010)	Overfished: Yes Overfishing: Not likely <sup>6</sup>
Relative Fishing Mortality: F <sub>2010</sub> /F <sub>MSY</sub>	0.99 (0.75-1.27) <sup>4</sup> 0.72 (0.51-0.93) <sup>5</sup>
Relative Biomass: B2010/BMSY SSB2010/SSBMSY	$0.50 (0.42-0.60)^4$ $0.322 (0.23-0.41)^5$
Current (2016) Yield	452 t <sup>3</sup>

<sup>3</sup> 2016 yield should be considered provisional.
<sup>4</sup> ASPIC estimates with 10 and 90 percentiles.
<sup>5</sup> SS3 estimates with approximate 95% confidence intervals.
<sup>6</sup> Overfishing could be occurring if catches are under reported.

**WHM-Figure 1**. Geographic distribution of white marlin total catches by decade (last decade only covers 6 years).

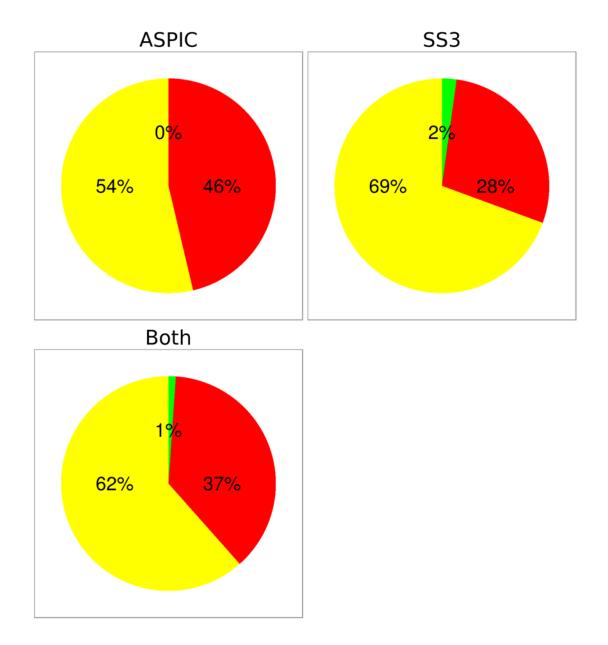

WHM-Figure 2. Total catch of white marlin reported in Task I for the period 1956-2016.

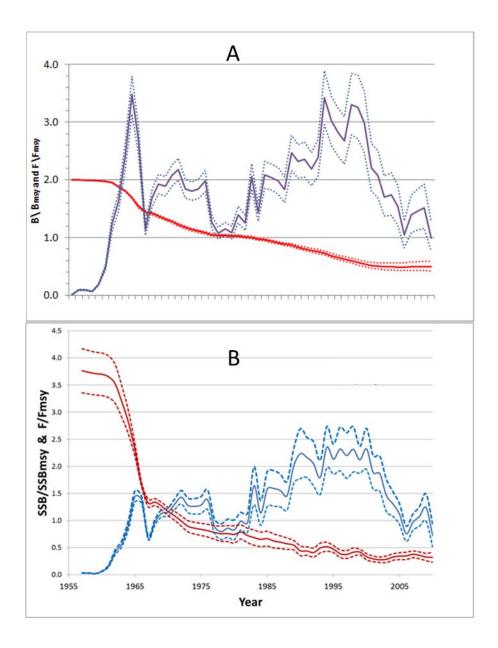

**WHM-Figure 3.** White marlin indices of abundance presented and selected during the meeting. For graphing purposes, the indices were scaled to their respective mean value for the period 1990-2010.

**WHM-Figure 4.** Kobe phase plot panel showing the estimated trajectories for stock (B) relative to  $B_{MSY}$  and harvest rate (F) relative to  $F_{MSY}$  (line) along with the bootstrap estimates for 2012. The green quadrant corresponds to the stock not being overfished and no overfishing occurring and the red quadrant to the stock being overfished and overfishing occurring. The red line represents the SS3 model, and the blue line represents the ASPIC model (large panel). The marginal densities plots for stock relative to  $B_{MSY}$  and harvest rate relative to  $F_{MSY}$  are also shown (top and right of large panel); the upper part (grey) are combined probabilities for both ASPIC and SS3, and the lower part (blue and pink) are individual probabilities of ASPIC and SS3 overlaid. The red lines represent the benchmark levels (ratios equal to 1.0).

**WHM-Figure 5.** Pie chart showing the proportion of assessment results for 2012 that are within the green quadrant of the Kobe plot chart (not overfished, no overfishing), the yellow quadrant (overfishing), and the red quadrant (overfished and overfishing).

**WHM-Figure 6.** Historical ASPIC (A) and SS3 (B) estimates of biomass over biomass at MSY ratio (red) and fishing mortality over fishing mortality at MSY ratios (blue) for white marlin.

# 8.8 SAI – SAILFISH

The most recent stock assessments for East and West sailfish were conducted in 2016 using catch data available to 2014, through a process that included meetings for data preparatory, and a catch rate standardization workshop in May. The previous sailfish stock assessments were conducted in 2009.

# SAI-1. Biology

Sailfish have a mainly pan-tropical distribution in the Atlantic Ocean, with occasional catches reported from temperate waters. Based on life history information, migration rates and geographic distribution of catch, ICCAT has established two management units for sailfish, eastern and western Atlantic stocks (SAI-Figure 1). However, a recent preliminary study investigating genetic differentiation among groups of Atlantic sailfish suggests genetic stock structure between both the eastern and western Atlantic, and northern and southern hemispheres, suggesting the need for further investigations to elucidate and confirm the presence of additional stock structure that may influence future assessments.

Sailfish is more coastally oriented than other billfish species. Conventional tagging data suggests they move shorter distances than the other billfish (**SAI-Figure 2**). Temperature preferences for adult sailfish appear to be in the range of 25-28°C. Sailfish generally seek out the warmest water available, and electronic tagging studies indicate that about 96% of darkness, 86% of twilight, and 82% of daylight hours are spent near the surface (Hoolihan *et al.* 2011). Vertical habitat use is more complex however, with frequent short duration excursions to deeper depths in excess of 100 m, with some dives as deep as 350 m.

Sailfish grow rapidly and reach a maximum size of 160 cm for males and 220 cm for females, with a mean maximum age of at least 12 years. A new length at 50% maturity (L50) has been estimated for West Atlantic female sailfish (146.12 cm LJFL); while the previous L50 value used for western sailfish males remains at 135.7 cm LJFL. No values are currently available for eastern Atlantic sailfish.

Sailfish spawn over a wide area and year around. For the western stock, evidence of spawning has been detected in the Straits of Florida, and off the Venezuelan, Guyanese and Surinamese coasts. In the southwestern Atlantic, spawning has been confirmed off the southern coast of Brazil between 20° and 27°S. Additional spawning areas occur in the eastern Atlantic off Senegal and Côte d'Ivoire. Timing of spawning can differ between regions; from the Florida Straits to the areas off Guyana western Atlantic sailfish spawn in the second and third quarter of the year, while in the southwestern Atlantic they spawn during the austral summer.

### SAI-2. Fisheries indicators

Sailfish are targeted by coastal artisanal and recreational fleets and are captured to a lesser extent as bycatch in longline and purse seine fisheries (**SAI-Figure 3**). Historically, catches of sailfish were reported together with spearfish by many longline fleets. In 2009 these catches were separated by the Committee (**SAI-Table 1**).

### East Atlantic

The eastern stock is exploited by surface fisheries, mainly artisanal gillnet and troll, and to a lesser degree by purse seine, as well as longline and recreational fisheries. The main surface fisheries are carried out by the artisanal fleets of Côte d'Ivoire, Ghana and Senegal followed by the EU mixed flags fleets (France and Spain) in the Gulf of Guinea and in the waters of the tropical eastern Atlantic. The main longline fleets are EU-Spain, Japan and Chinese Taipei fleets which operate in the central, eastern and western Atlantic. Total reported landings, increased abruptly after 1973, to peak above 5,000 t in 1975-1976, remaining relatively high (>2000 t), largely due to the incorporation of artisanal fishing effort by the traditional surface (gillnet and troll) fisheries (SAI-Table 1; SAI-Figure 3a). A generally decreasing trend in catch is apparent since 2008, mainly due to a decreased catch by the surface fisheries (gillnet and purse seine) (SAI-Figure 3a). Preliminary Task I catches of sailfish\_east in 2016 were 1,421 t, compared to 1,240 t reported for 2015 (SAI-Table 1).

#### West Atlantic

The western stock is exploited by longline, recreational fisheries, and by surface fisheries, mainly artisanal drift-gillnet. The main longline fleets include Brazil, EU-Spain, Venezuela and Grenada, which operate in the western and central Atlantic. The main surface fisheries are carried out by the artisanal fleets of Grenada and Venezuela in the Caribbean Sea and waters of the tropical western Atlantic.

Total reported landings steadily increased since 1960 to peak 2,060 t in 2002 (**SAI-Figure 3b**). A steep decreasing trend of catch is observed from 2005, mainly due to a decreased catch by the surface (artisanal drift-gillnet) fisheries. Preliminary Task I catches of sailfish west in 2016 were 739 t, compared to 874 t reported for 2015 (**SAI-Table 1**).

Although there has been some progress, historical catches of unclassified billfish continue to be reported to the Committee, confounding sailfish catch estimates. Catch reports from countries that have historically been known to land sailfish continue to suffer from gaps and there is increasing *ad hoc* evidence of unreported landings in some other countries. These considerations provide support to the idea that the historical catch of sailfish has been under-reported, especially in recent times where more and more fleets encounter sailfish as by-catch or direct targeting.

Several standardized CPUE data series were used in 2016 for the Atlantic sailfish stock assessment. For the eastern Atlantic stock, the eight indices of abundance used were: Côte d'Ivoire, Ghana, and Senegal artisanal, Chinese Taipei longline, Japan longline (early and late), EU-Portugal longline, and EU-Spain longline; for the western Atlantic stock, the eleven indices used were: Brazilian longline, Brazilian rod & reel, Chinese Taipei longline, Japanese longline (early and late), EU-Spain longline, US longline observer, US rod & reel, Venezuelan longline, Venezuelan rod & reel, and Venezuelan artisanal (**SAI-Figure 4**). For both stocks, the available CPUE time series showed a mixture of both decreasing and increasing trends, which demonstrated a potential conflict in the indicators of stock abundance. For this reason, CPUE time series were put into two groups, each based on the similarity of their indication of stock abundance (i.e., increasing or decreasing). In the assessment, these CPUE groups were considered as alternatives for the surplus production and Stock Synthesis models.

## SAI-3. State of the stocks

Important progress was made on the integration of new data sources, in particular standardized catch rate data, size data, and modeling approaches, in the 2016 assessment of the status of the stocks of Atlantic sailfish. For both stocks (East and West), uncertainty in data inputs and model configuration was explored through sensitivity analysis. They revealed that results were sensitive to structural assumptions of the models. The production model formulations and the Stock Synthesis model (applied for the western stock) had varying degrees of difficulty fitting the decreasing or increasing trends in the CPUE series. Overall, assessment results were uncertain and should be interpreted with caution. *East Atlantic* 

The Bayesian surplus production model, the ASPIC and the Stock Reduction Analysis models showed similar trends in biomass trajectories and fishing mortality levels; trends in abundance suggest that the stock suffered their greatest declines in abundance prior to 1990. Different model runs indicate a declining/increasing trend in recent years depending on the CPUE series selected. All the scenarios considered for advice using the surplus production models indicated that the stock is overfished (0.27- $0.71 \text{ B}_{MSY}$ ), but overfishing status is uncertain (0.33-2.85  $\text{F}_{MSY}$ ) (SAI-Figure 5).

#### West Atlantic

The ASPIC and the Bayesian surplus production models examined were heavily influenced by the priors used in the models. Neither model could provide stock status due to the large uncertainty in benchmark estimates, and generally poor model convergence. The point estimates of both Stock Synthesis models indicated that the stock is neither overfished nor experiencing overfishing (**SAI-Figure 6**). In contrast, the Stock Reduction Analysis model indicated that the stock was overfished with overfishing occurring (0.23-0.61 B<sub>MSY</sub>; 0.69-2.45 F<sub>MSY</sub>). However, due to the large degree of uncertainty in the Stock Reduction Analysis results, the Stock Synthesis models were used for management recommendations.

## SAI-4. Outlook

Both the eastern and western sailfish stocks may have been reduced to stock sizes below  $B_{MSY}$ . There is considerable uncertainty on the level of reduction. The results for the eastern stock were more pessimistic than those for the western stock in that more of the results indicated recent stock biomass below  $B_{MSY}$ . Therefore, there is particular concern over the outlook for the eastern stock.

Due to the difficulty of determining current status for both the eastern and western Atlantic stocks, the Committee considered that it was not appropriate to conduct quantitative projections of future stock condition based on the range of scenarios considered at the stock assessment meeting.

## SAI-5. Effect of current regulations

In 2016, the Commission established catch limits for both sailfish stocks [Rec. 16-11], and included several provisions that would allow the Committee enhance data collection initiatives to reduce fishing mortality estimates and overcome data gap issues in all fisheries.

#### East Atlantic

It was established that the total catch harvested must be no more than 67% of the average estimate of the Maximum Sustainable Yield (i.e., 1,271 t).

#### West Atlantic

It was established that the total catch harvested must be no more than 67% of the average estimate of the Maximum Sustainable Yield (i.e., 1,030 t).

If the catch limit is exceeded in any stock, the Commission shall review the implementation and effectiveness of the current regulation.

In line with other ICCAT conservation measures, some countries have established domestic regulations to limit the catch of sailfish. Among these regulations are: the requirement of releasing all billfish from longline vessels, minimum size restrictions, use of circle hooks and catch and release strategies in sport fisheries.

Currently, four ICCAT Contracting Parties (Brazil, Canada, Mexico, and the United States) mandate or encourage the use of circle hooks on their pelagic longline fleets. Recent research has demonstrated that in some longline fisheries the use of non-offset circle hooks resulted in a reduction of billfish mortality, while the catch rates of several of the target species remained the same or were greater than the catch rates observed with the use of conventional J hooks or offset circle hooks.

#### SAI-6. Management recommendations

Considerable uncertainty still remains in the assessments of both the eastern and western stocks. Available abundance indices demonstrate conflicting trends for both stocks, and there are concerns that reported catches, including dead discards, may be incomplete. Nevertheless, it should be noted that there have been significant improvements since the last assessment. There were more abundance indices available, and the standardizations have seen general improvement, fostered in part by the CPUE workshop held in advance of this meeting. As was the case during the 2009 Sailfish Stock Assessment Session (Anon. 2010), the results for the eastern stock were more pessimistic than the western stock in that more of the results indicated recent stock biomass below B<sub>MSY</sub>.

#### East Atlantic

The eastern Atlantic sailfish stock appears to have declined markedly since the 1970s, reaching a low in the early 1990s. There is broad agreement across model results that the stock is currently overfished. Since 2010, catches appear to have declined substantially. However, models disagree whether overfishing is occurring and whether the stock is recovering.

Based on the assessment results, and considering the associated uncertainties, the Commission recommended at a minimum that catches should not exceed 67% of 1,271 t [Rec. 16-11]. Considering the increase in catch levels during 2016, the Commission may consider alternative management measures to prevent further increases in catch levels.

#### West Atlantic

The Stock Synthesis models for the western Atlantic sailfish stock estimates MSY between 1,438-1,636 t. Although current catches are well below this level, the results of the assessment were highly uncertain, and therefore the Committee recommends that the western Atlantic sailfish catches should not exceed current levels.

ATLAN	NTIC SAILFISH SUMMARY	
	West Atlantic	East Atlantic
Maximum Sustainable Yield (MSY)	1,438-1,636 t <sup>1,2</sup>	1,635-2,157 t <sup>3</sup>
Current (2016)	739 t	1,421 t
SSB2014/SSB <sub>MSY</sub>	$1.81 (0.51 - 2.57)^1$	
	1.16 (0.18-1.69) <sup>2</sup>	
B2014/BMSY		0.22-0.70 <sup>3</sup>

SAI-Figure 3. Task I catches of sailfish for each of the two Atlantic stocks, East and West.

**SAI-Figure 4.** Relative abundance indices used in the assessments of eastern and western Atlantic sailfish stocks. All indices were scaled to the mean of each series prior to graphing.

**SAI-Figure 5**. Phase plot summarizing scenario outputs for the current (2014) stock status of Sailfish east (SAI\_east). SRA is Stock Reduction Analysis; E-up-equal wt to E-up-low process are BSMP-JAGS model runs, E1 GH1&GH2 is ASPIC base case model run.

**SAI-Figure 6**. Kobe plot (left) summarizing stock status of Sailfish\_west based on Stock Synthesis models with increasing CPUE trends (Model 1) and with decreasing CPUE trends (Model 2). The estimated trajectories and uncertainty points for Model 1 are shown in golden yellow, and in blue for Model 2. The marginal densities plots for stock relative to B<sub>MSY</sub> and harvest rate relative to F<sub>MSY</sub> are also shown (top and right of large panel); the upper part (grey) are combined probabilities for both Stock Synthesis models, and the lower part (colored) are individual probabilities of Model 1 and Model 2. The red lines represent the benchmark levels (ratios equal to 1.0). Pie charts showing summary of current stock status estimates for the Sailfish\_west stock based on Stock Synthesis models.

## 8.9 SWO-ATL – ATLANTIC SWORDFISH

The status of the North and South Atlantic swordfish stocks was assessed in 2017, by means of applying statistical modelling to the available data up to 2015. Complete information on the data availability and assessment can be found in the Reports of the 2017 ICCAT Swordfish Data Preparatory and Stock Assessment Meetings. Other information relevant to Atlantic swordfish is presented in the Report of the Sub-committee on Statistics, included as **Appendix 9** to this SCRS Report, and recommendations pertinent to Atlantic swordfish are presented in Item 19.

#### SWO-ATL-1. Biology

Swordfish (*Xiphias gladius*) are members of the family Xiphiidae and are in the suborder Scombroidei. They can reach a maximum weight in excess of 500 kg. They are distributed widely in the Atlantic Ocean and Mediterranean Sea. In the ICCAT Convention area, the management units of swordfish for assessment purposes are a separate Mediterranean group, and North and South Atlantic groups separated at 5°N. New genetic information was reviewed that indicated that the existing stock boundaries should be refined for the Atlantic and Mediterranean stocks. While recognizing the importance of the work, the Committee noted that the stock boundaries are approximations, and the possible impacts of seasonal changes and oceanographic processes in resource distribution need to be fully understood.

Swordfish feed on a wide variety of prey including groundfish, pelagic fish, deep-water fish, and invertebrates. They are believed to feed throughout the water column, and from electronic tagging studies, undertake extensive diel vertical migrations.

Swordfish mostly spawn in the western warm tropical and subtropical waters throughout the year, although seasonality has been reported in some of these areas. They are found in the colder temperate waters during summer and fall months. Young swordfish grow very rapidly, reaching about 140 cm LJFL (lower-jaw fork length) by age three, but grow slowly thereafter. Females grow faster than males and reach a larger maximum size. Tagging studies have shown that some swordfish can live up to 15 years. Swordfish are difficult to age, but about 50% of females were considered to be mature by age five, at a length of about 180 cm. However, the most recent information indicates a smaller length and age at maturity.

The analysis of the horizontal movements evidences seasonal patterns, with fish generally moving south by winter and returning to the temperate foraging grounds in spring. Broader areas of mixing between some eastern and western areas were also suggested. These new results obtained by pop-up satellite tags also fully confirm the previous knowledge that was available from fishery data: deep longline settings catch swordfish during the day-time as a by-catch, while shallow setting longliners target swordfish at night closer to the surface.

#### SWO-ATL-2. Fishery indicators

Due to the broad geographical distribution of Atlantic swordfish (**SWO ATL-Figure 1**) in coastal and offshore areas (mostly ranging from 50°N to 45°S), this species is available to a large number of fishing countries. **SWO ATL-Figure 2** shows total estimated catches for North and South Atlantic swordfish. Directed longline fisheries from Canada, EU-Spain, and the United States have operated since the late 1950s or early 1960s, and harpoon fisheries have existed at least since the late 1800s. Other directed swordfish fisheries include fleets from Brazil, Morocco, Namibia, EU-Portugal, South Africa, Uruguay, and Venezuela. The primary by-catch or opportunistic fisheries that take swordfish are tuna fleets from Chinese Taipei, Japan, Korea and EU-France. The tuna longline fishery started in 1956 and has operated throughout the Atlantic since then, with substantial catches of swordfish that are produced as a by-catch of tuna fisheries. The largest proportion of the Atlantic catches is made using surface-drifting longline. However, many additional gears are used, including traditional gillnets off the coast of western Africa.

Trends by area (NE vs. NW Atlantic) in the CPUE indexes were consistent with the seasonal movement patterns observed in the electronic tagging data, as well as in the catches and sex-ratio distributions. Relationships observed for the eastern Atlantic were opposite to those in the western Atlantic. This pattern was correlated with the decadal cycling of the AMO as well as that of the North Atlantic Oscillation (NAO). Including the AMO as a covariate to area specific catchability within the assessment model helped reduce the conflicting directions of the various CPUE trends. Further analysis and hypothesis testing was

recommended to determine if the relationship was due to a swordfish temperature preference, a change in prey distribution, or perhaps both. To support this hypothesis testing the Group encouraged a group of swordfish scientists to work towards uniting the available North Atlantic swordfish CPUE data into a single dataset so that a more refined, area specific CPUE analyses could be conducted.

For both the North and South Atlantic some of the indices of abundance were affected by changes in gear technology and management that could not be accounted for in the CPUE standardization, and therefore had to be split.

## Total Atlantic

The total Atlantic estimated catch (landings plus dead discards) of swordfish (North and South, including reported dead discards) in 2016 (18,129 t) was 13.7% lower than the reported catch of 2015 (20,998 t). As a small number of countries have not yet reported their 2016 catches and because of unknown unreported catches, this value should be considered provisional and subject to further revision.

The trends in mean fish weight taken in the North and South Atlantic fisheries are shown in **SWO-ATL-Figure 3**.

## North Atlantic

For the past decade, the North Atlantic estimated catch (landings plus dead discards) has averaged about 12,000 t per year (**SWO-ATL-Table 1**). The catch in 2016 (10,404 t) represents a 48,6% decrease since the 1987 peak in North Atlantic landings (20,238 t). These reduced landings have been attributed to ICCAT regulatory recommendations and shifts in fleet distributions, including the movement of some vessels in certain years to the South Atlantic or out of the Atlantic. In addition, some fleets, including at least the United States, EU-Spain and EU-Portugal have changed operating procedures to opportunistically target tuna and/or sharks, taking advantage of market conditions and higher relative catch rates of these species previously considered as by-catch in some fleets. Recently, socio-economic factors may have also contributed to the decline in catch.

Available catch per unit effort (CPUE) series were evaluated by the Committee and certain indices were identified as suitable for use in the assessment models (Canada, EU-Portugal, EU-Spain, Japan, Morocco, and USA). Trends in standardized CPUE series by fleets contributing to the stock assessment models are shown in **SWO-ATL-Figure 4**. Most of the series have an increasing trend since the late 1990s, but show a decrease in the more recent years. There have been some recent changes in United States regulations that may have impacted catch rates. The combined index used as the continuity model from the previous assessment is shown in **SWO-ATL-Figure 5**.

#### South Atlantic

The historical trend of catch (landings plus dead discards) can be divided in two periods: before and after 1980. The first one is characterized by relatively low catches, generally less than 5,000 t (with an average value of 2,300 t). After 1980, landings increased continuously up to a peak of 21,930 t in 1995, levels that are comparable to the peak of North Atlantic harvest (20,238 t in 1987). This increase of landings was, in part, due to progressive shifts of fishing effort to the South Atlantic, primarily from the North Atlantic, as well as other waters. Expansion of fishing activities by southern coastal countries, such as Brazil and Uruguay, also contributed to this increase in catches. The reduction in catch following the peak in 1995 resulted from regulations and was partly due to a shift to other oceans and target species. In 2016, the 7,725 t of reported catch was about 65% lower than the 1995 reported level (**SWO-ATL-Table 1**). The SCRS received reports from Brazil and Uruguay over the last years that they have reduced their fishing effort directed towards swordfish in recent years. Uruguay recently received increased albacore quotas that may allow increased effort for swordfish in the near future.

Available catch per unit effort (CPUE) series for the south Atlantic swordfish were evaluated by the Committee and certain indices were identified as suitable for use in assessment models (Brazil, EU-Spain, Japan, South Africa, Uruguay). The available indices are illustrated in **SWO-ATL-Figure 6**.

## Discards

Since 1991, very few fleets have reported dead discards (see **SWO-ATL-Table 1**). The volume of Atlanticwide reported discards by these fleets has ranged from a minimum of 157 t in 2009 to a maximum of 1,139 t in 2000, with 105 t reported for 2016. The Committee continued to express concerns due to the low percentage of fleets that have reported annual dead discards (in t) in recent years and that what has been reported is not necessarily scaled to the entire fishery.

## SWO-ATL-3. State of the stocks

## North Atlantic

Three stock assessment platforms were used to provide estimates of stock status for the North Atlantic swordfish stock, a surplus production model (ASPIC - *A Stock Production Model Incorporating Covariates*), a Bayesian surplus production model with process error (BSP2 - *Bayesian Surplus Production 2*) and an integrated assessment model (SS - *Stock Synthesis*). Stock status was determined from SS and BSP2 models, while ASPIC was used mainly to provide continuity with the previous assessments.

The final base case SS model estimated that  $B_{2015}$  was above  $B_{MSY}$  (median = 1.13, 95% CIs = 0.81-1.45) and  $F_{2015}$  was lower than  $F_{MSY}$  (median = 0.75, 95% CIs = 0.57-0.92) (**SWO-ATL-Figure 7**). The final base case BSP2 model estimated that current biomass ( $B_{2015}$ ) was near  $B_{MSY}$  (median = 0.99, 95% CIs = 0.77-1.24) and current  $F_{2015}$  was lower than  $F_{MSY}$  (median = 0.81, 95% CIs = 0.61-1.10) (**SWO-ATL-Figure 8**). Both models agreed that overfishing is not occurring and that biomass is either higher or very close to  $B_{MSY}$  (**SWO-ATL-Figure 9**). The estimate of stock status in 2017 is slightly more pessimistic than the estimated status in the previous 2009 and 2013 assessments, and suggests that in 2015 there was a 61% probability that the stock is at or above MSY reference levels. The results obtained in this evaluation are not strictly comparable with those obtained in the last assessments due to the incorporation of more data sources, and using joint probabilities from two base case models, and updated catch and CPUE information.

The most recent estimates of stock productivity are lower than the previous estimates. Compared with the previous 2009 and 2013 ASPIC base case models, the trajectory of biomass are similar until the late 1990s, thereafter the current model predicted considerable lower relative biomass (**SWO-ATL-Figure 10**). It is particularly noteworthy that the CPUE series have been decreasing since 2012, causing biomass trends to adjust to a lower minimum compared to the previous assessments.

The Committee noted that the 2017 assessment represents a significant improvement in the understanding of current stock status for North Atlantic swordfish using updated information and integration of the new data sources. The Committee therefore recommends that management advice for North Atlantic swordfish, including stock status and projections, should be based on BSP2 and SS models.

#### South Atlantic

In 2017, evaluation of the status of the South Atlantic swordfish stock was assessed using two Bayesian biomass dynamics production models with process error (BSP2 and JABBA - *Just Another Bayesian Biomass Assessment*). Stock status and projections were determined from JABBA, while BSP2 was used mainly to provide several sensitivity analyses.

The results from both models for the South Atlantic swordfish were consistent. The final base case BSP2 model estimated that current biomass (B<sub>2015</sub>) was lower than B<sub>MSY</sub> (median = 0.64, 95% CIs = 0.43-1.00) and current F<sub>2015</sub> was higher than F<sub>MSY</sub> (median = 1.15; 95% CIs = 0.61-1.82) (**SWO-ATL-Figure 11**). The final base case JABBA model estimated that B<sub>2015</sub> was also below B<sub>MSY</sub> (median = 0.72, 95% CIs = 0.53-1.01) while F<sub>2015</sub> was very close to F<sub>MSY</sub> (median = 0.98, 95% CIs = 0.70-1.36) (**SWO-ATL-Figure 12**).

Both models agreed that the southern swordfish stock biomass is overfished, and that overfishing is either occurring or current F is very close to  $F_{MSY}$ . The Committee agreed that either one of the models (BSP2 or JABBA) could be used for management advice, but given that both are very similar in structure and use of information only one should be used. Given that JABBA is written in open-source software with more capabilities for future evolutions, the Committee agreed that the management advice, including stock status and projections, should be based on JABBA model (**SWO-ATL-Figure 13**).

The results obtained in this assessment are not comparable with those obtained in the last assessment (2013) due to the use of individual CPUEs compared to the use of a single CPUE combined across indices in the previous assessment. There was also an informative prior for K based on values from the North Atlantic in the 2013 assessment, but not in the current assessment. In 2013, the Committee noted that it was unknown whether it was possible to obtain higher yields from the stock as BSP2 suggested, or whether the stock was already fully exploited as ASPIC suggested. In 2017, with the possibility of incorporating individual CPUEs series and without the need to establish strong assumptions in productivity based in the North Atlantic stock, it was possible to provide specific quantitative advice for this stock.

## SWO-ATL-4. Outlook

## North Atlantic

Results from the previous 2013 assessment indicated that there was a greater than 90% probability that the northern swordfish stock had rebuilt to or above  $B_{MSY}$ . However, given the new estimates of biomass and lower productivity, the stock status now shows a 61% probability of being above  $B_{MSY}$ .

Based on the currently available information to the Committee, both the BSP2 and SS base models were projected to the year 2028 under constant TAC scenarios of 8 to 19 thousand tons. Projections used reported catch as of July, 2017 for 2016. For those CPCs whose reported catch was not available, their catch was assumed to be the average of the last three years (2013-2015), giving a total catch of 11,296 t.

For the final base case BSP2 model, projections incorporated process error and the predicted trajectories are therefore more realistic of the future uncertainty in the stock status. MSY is estimated to be around 13,400 t, and taking into account current stock status and process error catches around 13,000 t are expected to allow the population to remain at or above  $B_{MSY}$  throughout the projected time period (**SWO-ATL-Figure 14**).

For the final base case SS model, projections of stock status at various levels of future catch are shown in **SWO-ATL-Figure 14**. Given the current status of the stock being quite close to the MSY benchmarks, values of catches around 13,000 t are also projected to maintain biomass above  $B_{MSY}$  during the projected time frame.

#### South Atlantic

Projections were conducted for the final base case JABBA model under constant TAC scenarios of 4 to 16 thousand tons. Projections used reported catch as of July 2017 for 2016. For those CPCs whose reported catch was not yet available, it was assumed that their catch was the average of the last three years (2013-2015), giving a total catch of 10,002 t.

Although the median MSY was around 14,600 t, the 2015 biomass depletion level at  $B/B_{MSY} = 0.72$  would require catches be reduced to a level at or below 14,000 tons to rebuild the population to biomass levels that can produce MSY by the end of the projection period in 2028 (**SWO-ATL-Figure 15**).

## SWO-ATL-5. Effect of current regulations

In 2006, the Committee provided information on the effectiveness of existing minimum size regulations. New catch regulations were implemented on the basis of Rec. 06-02, which entered into effect in 2007 (Rec. 08-02 extended the provisions of Rec. 06-02 to include 2009). Rec. 09-02 came into effect in 2010 and extended most of the provisions of Rec. 06-02 for one year only. Rec. 10-02 came into effect in 2011, and again extended those provisions for one year only, but with a slight reduction in total allowable catch (TAC). For the North and South Atlantic, the most recent recommendations can be found in Recs. 16-03 and 16-04. *Catch limits* 

The total allowable catch in the North Atlantic during the 2007 to 2009 period was 14,000 t per year. The reported catch during that period averaged 11,811 t and did not exceed the TAC in any year. In 2010, the TAC was reduced to 13,700 t. The reported catch since then averaged 11,682 t and exceeded the TAC in one year (2012, 13,868 t).

The total allowable catch in the South Atlantic for the years 2007 through 2009 was 17,000 t. The reported catch during that period averaged 13,674 t, and did not exceed the TAC in any year. In 2010, the TAC was reduced to 15,000 t. The reported catch since then averaged 10,150 t and did not exceed the TAC in any year.

## Minimum size limits

There are two minimum size options that are applied to the entire Atlantic: 125 cm LJFL with a 15% tolerance, or 119 cm LJFL with zero tolerance and evaluation of the discards.

Since the implementation of the minimum landing sizes in 2000, the estimate of percentage of swordfish less than 125 cm LJFL reported landed (in number) has been generally decreasing in the North Atlantic and stable in the South. In the North Atlantic, the estimate was 33% in 2000 and decreased to 23% in 2015. In the South Atlantic the estimate was 18% in 2000, had a maximum of 19% in 2006 and decreased to 13% in 2015. The Committee notes that these estimations have high levels of substitutions for a significant portion of the total catch and are highly unreliable and biased unless CPCs fully report size samples from the entire catch.

The Committee also noted high values of hooking mortality (ranging between 78-88%) on small swordfish (<125 cm LJFL) on some surface longline fisheries targeting swordfish, with the post-release mortality of specimens discarded alive unknown. Recommend and evaluating other strategies to protect juvenile swordfish will need completeness of datasets on fishing effort and size data over the entire Atlantic and should take into account the effects on other species. In view of the Commission objective to protect small swordfish, the Committee therefore recommends that future work should be carried out to determine more precisely the spatial distribution and magnitude of fishing effort, size and sex distribution of undersized swordfish in the Atlantic, using high resolution observer data.

## SWO-ATL-6. Management recommendations

## North Atlantic

**SWO-ATL-Tables 2, 3 and 4** show, respectively, the probabilities of maintaining the stock in the green quadrant of the Kobe plot, maintaining  $B>B_{MSY}$  and maintaining  $F<F_{MSY}$ , over a range of TAC options for North Atlantic swordfish over a period of 10 years. The current TAC of 13,700 t has a 36% probability of maintaining the North Atlantic swordfish stock in the green quadrant of the Kobe plot by 2028, whereas a TAC of 13,200 t would have a 50% probability, and would also result in the biomass being above  $B_{MSY}$  with a probability greater than 50%, consistent with Rec. 16-03 (**SWO-ATL-Table 3**).

The Committee also recognizes that the above advice does not account for removals associated with the actual mortality of unreported dead and live discards, quota carryovers (15% in the North Atlantic), quota transfers across the North and South stock management boundaries nor the total cumulative quota, which includes that allocated to "other CPCs" and would fall above the TAC if achieved. The Committee emphasizes the importance of this uncertainty particularly given that the current estimated biomass is close to B<sub>MSY</sub>.

#### South Atlantic

**SWO-ATL-Tables 5, 6 and 7** show, respectively, the probabilities of maintaining the stock in the green quadrant of the Kobe plot, maintaining  $B>B_{MSY}$  and maintaining  $F<F_{MSY}$ , over a range of TAC options for South Atlantic swordfish over a period of 10 years. The current TAC of 15,000 t has a 26% probability of rebuilding the South Atlantic swordfish stock to within MSY reference levels by 2028, whereas a TAC of 14,000 t would have a 50% probability of rebuilding the stock.

The Committee also recognizes that the above advice does not account for removals associated with the actual mortality of unreported dead and live discards, quota carryovers (30% in the South Atlantic) nor quota transfers across the North and South stock management boundaries. The Committee emphasizes the importance of this uncertainty particularly given that the current estimated biomass is lower than B<sub>MSY</sub>.

ATLAN	TIC SWORDFISH SUMMARY

## 8.10 SWO-MED – MEDITERRANEAN SWORDFISH

In the last 4 years the Mediterranean swordfish production is stable at around 10,000 t and it is comparable to that observed for much larger areas such as the North and South Atlantic. This may suggest that the biological and oceanographic conditions prevailing in the Mediterranean favour the high productivity of large pelagic fish. The most recent assessment was conducted in 2016, making use of the available catch, effort and size information through 2015. The present report summarizes assessment results and readers interested in more detailed information on the state of the stock should consult the report of the latest stock assessment session.

## SWO-MED-1. Biology

Research results based on genetic studies have demonstrated that Mediterranean swordfish compose a unique stock separated from the Atlantic ones, although there is incomplete information on stock mixing and boundaries. Although mixing between stocks is believed to be low and generally limited to the region around the Strait of Gibraltar, past biological and genetic studies have suggested the possible occurrence of mixing between the Mediterranean and North Atlantic stocks west of the 05°W boundary separating the two stocks. It is very likely that an important fraction of fish caught in this area belongs to the Mediterranean stock but further studies are needed to identify the degree of mixing among stocks. A brief review of past tagging experiments indicated that the existing results cannot provide robust information about mixing patterns and confirmed that further work is needed on this aspect.

According to previous knowledge, the Mediterranean swordfish have different biological characteristics compared to the Atlantic stock. The growth parameters are different, and the sexual maturity is reached at younger ages than in the Atlantic.

In the western Mediterranean, mature females as small as 110 cm LJFL have been observed and the estimated size at which 50% of the female population is mature occurs at about 140 cm. According to the growth curves used by the SCRS, these two sizes correspond to 2 and 3.5 year-old fish, respectively. Males reach sexual maturity at smaller sizes and mature specimens have been found at about 90 cm LJFL. Based on the fish growth pattern and the assumed natural mortality rate of 0.2, the maximum yield would be obtained through instantaneous fishing at age 6, while current catches are dominated, in terms of number, by fish less than 4 years old.

Based on the analysis of large data sets, integrating information from different areas, and on information from past studies, the Committee has suggested new Mediterranean-wide equations for different length-weight relationships and weight conversions. It was, however, noted that fisheries and time dependent relationships may perform better at given conditions and should be preferred, if available.

#### SWO-MED-2. Fishery indicators

Mediterranean swordfish landings showed an upward trend from 1965-1972, stabilized between 1973-1977, and then resumed an upward trend reaching a peak in 1988 (20,365 t; **SWO-MED-Table 1**, **SWO-MED-Figure 1**). The sharp increase between 1983 and 1988 may be partially attributed to improvement in the national systems for collecting catch statistics; thus earlier catches may be higher than those appearing in Task I tables. Since 1988 and up to 2011, the reported landings of swordfish in the Mediterranean Sea have declined fluctuating mostly between 12,000 to 16,000 t. In the last five years (2012-2016), following the implementation of the three-month fishery closure and the establishment of the list of authorized vessels, overall fishing effort has been decreased and catches are around 9-10,000 t. In general, these catch levels are relatively high and similar to those of bigger areas such as the North Atlantic. This could be related to higher recruitment levels in the Mediterranean than in the North Atlantic, different reproduction strategies (larger spawning areas in relation to the area of distribution of the stock) and the lower abundance of large pelagic predators (e.g. sharks) in the Mediterranean. Updated information on Mediterranean swordfish catch by gear type is provided in **SWO-MED-Table 1** and **SWO-MED-Figure 1**. The provisional Task I catch for 2015 that was used in the assessment was 9,966 t, which is among the lowest annual catches since 1983. The biggest producers in the recent years (2003-2015) are EU-Italy (45%), EU-Spain (13%), EU-Greece (10%), Morocco (14%), and Tunisia (7%). Also, Algeria, EU-Cyprus, EU-Malta and Turkey have fisheries targeting swordfish in the Mediterranean. Minor catches of swordfish have also been reported by Albania, EU-Croatia, EU-France, Japan, and Libya.

In the recent years (2003-2016), the main fishing gears used are longlines (on average, representing around 85% of the annual catch) and gillnets. Since 2012, gillnets have been officially eliminated following ICCAT recommendations for a general ban of driftnets in the Mediterranean. Minor catches are also reported from harpoon, trap and fisheries targeting other large pelagic species (e.g. albacore). From 2007-2010 a mesopelagic longline gear has been gradually introduced and nowadays has partially replaced the surface longline gear in several Italian and Spanish swordfish fleets. This is particularly noteworthy, as these fisheries are among the largest within the stock area, and the changes have implications for the use of catch rates as indices of abundance in the stock assessments.

Standardised CPUE series from different longline fisheries targeting swordfish that were used in the 2016 stock assessment session, did not reveal any overall trend over time (**SWO-MED-Figure 2**). It should be noted that CPUE series did not cover the earlier years of the reported landings. No trend over the past 30 years was identified regarding the mean fish weight in the catches (**SWO-MED-Figure 3**).

## SWO-MED-3. State of the stocks

It should be noted that the assessment results and projections presented here are based on the results of the 2016 assessment, including data up to 2015 that were available at the time of the assessment (July 2016).

Under different assumptions about natural mortality rates and reporting levels of undersized fish in the catch, age-structured analysis (XSA) indicated that current SSB levels are much lower than those in the 80s, although no trend appears since then.

XSA results indicate that recruitment shows a declining trend in the last decade, while stock biomass remains stable at low levels that are about 1/3 of that in the mid 1980s (**SWO-MED-Figure 4**). There appears to have been a recent decline in F in the last decade.

Results of equilibrium yield analyses based on the XSA assessment indicated that the stock is both overfished and subject to overfishing, with a 100% probability. Current (2015) SSB is less than 15% of  $B_{MSY}$  and F is almost twice the estimated  $F_{MSY}$  (**SWO-MED-Figure 5**). Results indicate that the stock is overfished throughout the whole period considered in the XSA assessment (1985-2015).

The Committee again noted the large catches of small size swordfish, i.e. less than 3 years old (many of which have probably never spawned) and the relatively low number of large individuals in the catches. Fish less than three years old usually represent 50-70% of the total yearly catches in terms of numbers (**SWO-MED-Figure 6**). A reduction of the volume of juvenile catches would improve yield per recruit and spawning biomass per recruit levels.

## SWO-MED-4. Outlook

The assessment of Mediterranean swordfish indicates that the stock is overfished and suffering overfishing. The stock has been in this state since the late 1980s because of the large catches in the 1980s and the selection pattern which captures many immature fish. Catches of immature fish remain high and the greatest mortality is suffered by fish of age 3. Recruitment has been declining for the last 10 years, and recent recruitments have been lower than the level expected to be available given recent levels of SSB.

Based on the stock status estimates, once the stock is rebuilt, a reduction of current F to the  $F_{MSY}$  level would result in a substantial (about five times) long term increase in SSB. The above findings, however, should be faced with caution as there is considerable uncertainty in regards to the possible levels of future recruitment given the assumed high steepness of the S/R relationship. It is unclear whether the most recent low levels are associated with a change in stock productivity, if they are an artefact of the estimation process, or if they are due to a temporary reduction in recruitment that could be reverted naturally by a series of positive recruitment anomalies. It is worth mentioning that the estimated SSB<sub>MSY</sub> levels are twice as much higher than the SSB values estimated before the full expansion of the fishery. Correspondingly, the estimated  $F_{MSY}$  is lower than all historical F values. Given the uncertainties on optimum SSB level estimates and the rapid fishery expansion in the 1980s, which resulted in severe stock biomass declines, the SSB levels before the expansion of the fisheries may be also considered as a B<sub>MSY</sub> proxy for the stock. These levels are around 30,000 t, more than 50% lower than the currently estimated B<sub>MSY</sub> value. (~63,000 t).

Projections of 20% fishing mortality reductions based on highly-aggregated data derived from the agestructured assessment assuming the current exploitation pattern and the assumption of reverting recruitment to the 1980s levels, according to estimated S/R relationship, are forecast to be beneficial in moving the stock condition closer to the Convention objective, resulting in substantial SSB increases in the medium-long term (8-12 years) and bringing SSB to the late 80s' levels. Projection results are summarized in **SWO-MED-Figure 7**.

#### SWO-MED-5. Effect of current regulations

ICCAT imposed a Mediterranean-wide one month fishery closure for all gears targeting swordfish in 2008, followed by a two-month closure since 2009. Through Recommendations 11-03 and 13-04 the Commission has adopted additional management measures intended to bring the stock back to levels that are consistent with the ICCAT Convention objective. Those measures include an additional one month closure accompanied by minimum catching size regulations, a list of authorized vessels, and specifications on the technical characteristics of the longline gear. Recently, through Rec. 16-05, which replaced Rec. 13-04, a 15-year recovery plan has been adopted. In addition, increased catching size, and fishing capacity limitations were established, accompanied by TACs and a seasonal closure of the albacore fishery to reduce juvenile swordfish by-catches. The European Union introduced a driftnet ban for highly migratory species in 2002 and in 2003 ICCAT adopted a recommendation for a general ban of this gear in the Mediterranean [Rec. 03-04]. Rec. 04-12 forbids the use of various types of nets and longlines for sport and recreational fishing for tuna and tuna-like species in the Mediterranean.

After the adoption of the aforementioned recommendations, reported catches have decreased significantly from the 2000s' level, being the catches of the period 2012-2016 among the lower of the last three decades. In addition, reported catches of juvenile swordfish of less than 90 cm have also decreased more than 50%, compared with the levels of the decade of 2000s. As the additional measures foreseen under Rec. 16-05 have only recently been adopted, their effects cannot be evaluated.

#### SWO-MED-6. Management recommendations

Over the last 25 years biomass levels appear to be rather stable at low levels. This situation has remained the same since the previous assessment of 2014. However, fishing mortality levels have shown a declining trend since 2010. Assessment of stock status and reference points were done under the assumption that recruitment levels can come back up to the levels seen in the past (1980's and 1990's). Under such assumption the stock is currently overfished and suffering overfishing. According to the Commission objectives the stock requires rebuilding and fishing mortality has to be reduced in accordance with Rec. 11-13. The level of the stock to be rebuilt, is contingent on the assumption on future recruitment which is highly uncertain. In order for rebuilding to start taking place there will be a need for substantial reductions in harvest (**SWO-MED-Tables 2-3**). Additionally, for the SCRS to be able to reduce uncertainty in regards to future recruitment, there will be a need to increase monitoring of landings and discards, also taking into account that since the establishment of minimum catching sizes, the discard levels of undersized swordfish may have increased.

**SWO-MED-Figure 7.** Projections based on the current selection pattern and three different F (harvest) levels: status quo (blue), 80% of current F (red) and  $F_{MSY}$  (green). Estimates are based on the XSA assessment assuming a discard rate of 4 zero-age fish/t. Lines correspond to median estimates and ribbons to inter-quartiles.

#### 8.11 SBF - SOUTHERN BLUEFIN TUNA

The Commission for the Conservation of Southern Bluefin Tuna (CCSBT) is charged with assessing the status of southern bluefin tuna. Each year the SCRS reviews the CCSBT report in order to know the research on southern bluefin tuna and the stock assessments carried out. The reports are available from the CCSBT.

## 8.12 SMT – SMALL TUNAS

## SMT-1. Generalities

The species under the Small Tunas Species Group include the following tuna and tuna-like species:

-	BLF	Blackfin tuna (Thunnus atlanticus)
-	BLT	Bullet tuna ( <i>Auxis rochei</i> )
-	BON	Atlantic bonito (Sarda sarda)
-	BOP	Plain bonito (Orcynopsis unicolor)
-	BRS	Serra Spanish mackerel (Scomberomorus brasiliensis)
-	CER	Cero (Scomberomorus regalis)
-	FRI	Frigate tuna (Auxis thazard)
-	KGM	King mackerel (Scomberomorus cavalla)
-	KGX	Scomberomorus unclassified (Scomberomorus spp.)
-	LTA	Little tunny (Euthynnus alletteratus)
-	MAW	West African Spanish mackerel (Scomberomorus tritor)
-	SSM	Atlantic Spanish mackerel (Scomberomorus maculatus)
-	WAH	Wahoo (Acanthocybium solandri)
-	DOL	Dolphinfish (Coryphaena hippurus)

Knowledge on the biology and fishery of small tunas is very fragmented. Furthermore, the quality of the knowledge varies according to the species concerned. This is due in large part to the fact that these species are often perceived to have little economic importance compared to other tunas and tuna-like species, and owing to the difficulties in conducting sampling of the landings from artisanal fisheries, which constitute a high proportion of the fisheries exploiting small tuna resources. The large industrial fleets often discard small tuna catches at sea or sell them on local markets mixed with other by-catches, especially in Africa. The amount caught is rarely reported in logbooks; however observer programs from purse seine fleets have recently provided estimates of catches of small tunas.

Small tuna species can reach high levels of catches and values in some years and have a very high relevance from a social and economic point of view, because they are important for many coastal communities in all areas and a main source of food. Their social and economic value is often not evident because of the underestimation of the total landing figures, due to the difficulties in data collection mentioned above. Several statistical problems are also caused by misidentification.

Scientific collaboration between ICCAT, Regional Fisheries Organizations (RFOs) and countries in the various regions is imperative to advance understanding of the distribution, biology and fisheries of these species.

# SMT-2. Biology

Small tuna species are widely distributed in the tropical and subtropical waters of the Atlantic Ocean and several are also distributed in the Mediterranean Sea and the Black Sea. Some species extend their range even into colder waters, like the North and South Atlantic Ocean. They often form large schools with other small sized tunas or related species in coastal and high seas waters.

Generally, the small tuna species have a varied diet with a preference for small pelagics (e.g. clupeids, mullets, carangids, etc.). Small tunas are the prey of large tunas, marlins, sharks and marine mammals which at the same time are predators of small pelagics. A recent document on the feeding habit of dolphin fish off the Brazilian coast showed that these species also feed on crustaceans, mollusks and cephalopods. The reproduction period varies according to species and areas and spawning generally takes place near the coast in oceanic areas, where the waters are warmer. A study conducted on the eastern coast of Tunisia has shown that the spawning area of the bullet tuna is offshore at the limit of the continental shelf and related to the high abundance of the zooplankton. A more recent study based on the histological analysis and the gonado-somatic index of female gonads found that the spawning season of the West African Spanish mackerel extends from April to July in the Gulf of Guinea. The results from preliminary studies conducted on Atlantic bonito in the northwestern coasts of Africa showed that this species reaches its first sexual maturity between 38 and 49 cm FL and the spawning period extends from May to July. For blackfin tuna, a new study revealed that the first size of maturity of this species was estimated at 45 cm FL and that this species spawns from March to August.

The growth rate currently estimated for these species is very rapid for the first two or three years, and then slows as they reach size-at-first maturity. Information on the migration patterns of small tuna species is very limited, due to low tagging levels of these species. However, a new genetic study showed that there is a clear genetic heterogeneity for the bullet tuna among different geographical locations in the Mediterranean, suggesting that the population structure of this species in the Mediterranean is more complex than initially expected. This study revealed also the presence of few individuals caught in Strait of Gibraltar genetically identified as *Auxis thazard*. A recent preliminary genetic study of blackfin tuna in the western Atlantic Ocean using microsatellite markers, concluded that there were very weak levels of divergence among different geographic areas sampled.

The bullet tuna caught in the Spanish Mediterranean coast showed a positive allometric growth with no effect of sex on growth. Another recent study showed that the bullet tuna (age class 3+) caught in the same area had a better physical condition during years with positive NAO phase. These results could be explained by the environmental conditions during positive NAO phase that would enhance the migration process.

A study conducted recently along the Gulf of Gabes (Ionian Sea-Mediterranean) indicated that the Larvae of the bullet tuna were mainly concentrated between the isobaths 50 and 200 m, and the spawning grounds of this species were mainly offshore.

In general, biological information remains incomplete or need to be updated for the majority of species in the major fishing areas (**SMT-Table 2**).

## SMT-3. Fisheries indicators

Small tunas are exploited mainly by coastal fisheries and artisanal fisheries, although substantial catches are also made as target species and as by-catch by purse seine, mid-water trawl (i.e. pelagic fisheries of West Africa-Mauritania), handline and small scale gillnets. Unknown quantities of small tuna also comprise the incidental catches of some longline fisheries. The increasing importance of FAD fisheries in the eastern Caribbean and in other areas has improved the efficiency of artisanal fisheries in catching small tunas. Various species are also caught by the sport and recreational fisheries.

Despite the scarce monitoring of various fishing activities in some areas, all the small tuna fisheries have high social and economic relevance for most of the coastal countries concerned and for many local communities, particularly in the Mediterranean Sea, in the Caribbean region and in West Africa.

**SMT-Table 1** shows historical landings of small tunas for the 1989 to 2016 period although the data for the last years are preliminary. This table does not include species reported as "mixed" or "unidentified", as was the case in the previous years, since these categories include large tuna species. Seven (7) of 13 species represent more than 90% of small tuna Task I catches between 1950 and 2016: BON (34%), LTA (14%), FRI (12%), KGM (11%), SSM (11%), BRS (5%) and BLT (5%). In 1980, there was a marked increase in reported landings compared to previous years, reaching a peak of about 145,560 t in 1988 (**SMT-Figure 1**). The annual trend in the total catches by species are shown in **SMT-Figure 2**. Reported landings for the 1989-1995 period decreased to approximately 91,764 t, and then an oscillation in the values in the following years, with a minimum of 64,450 t in 2008 and a maximum of 132,275 t in 2005. Overall trends

in the small tuna catch may mask declining trends for individual species because annual landings are often dominated by the landings of single species. These fluctuations seem to be related to unreported catches, as these species generally comprise part of the by-catch and are often discarded, and therefore do not reflect the real catch.

A preliminary estimate of the total nominal landings of small tunas in 2016 is 98,879 t. The Committee pointed out the relative importance of small tuna fisheries in the Mediterranean and the Black Sea, which account for about 20% of the total reported catches (1950 to 2016) in the ICCAT area.

Despite the recent improvements in the statistical information provided to ICCAT by several countries, the Committee noted that uncertainties remain regarding the accuracy and completeness of reported landings in all areas. There is a general lack of information on the mortality of these species as by-catch.

However, after the adoption of the ICCAT Small Tunas Research Programme (SMTYP) in 2012, significant historical catch, effort and size data from the artisanal fisheries in the west of Africa (Senegal, Côte d'Ivoire and Morocco) and from the Mediterranean Sea (EU-Spain and EU-Italy) were recovered and made available to the Secretariat.

The results from a new larval survey in the Gulf of Mexico showed that the values of spawning biomass indices for little tunny, and *Auxis* genus were variable throughout the time series (1982-2015), and did not show any clear trend. The highest index values occurred in 1995 and 2002, while the lowest was observed in 2015. For dolphinfish, index values were also variable throughout the time series, with lowest values occurring in 1987, 1988 and 2001, while the highest were registered in 2013 and 2015.

## SMT-4. State of the stocks

There is little information available to determine the stock structure of many small tuna species. The Committee suggests that countries be requested to submit all available data to ICCAT as soon as possible, in order to be used in future meetings of the Committee.

Generally, current information does not allow the Committee to carry out quantitative assessments of stock status of the majority of the species. Nevertheless, few regional assessments have been carried out. Assessments of stocks of small tunas are also important because of their position in the trophic chain. It may therefore be best to approach assessments of small tunas from the ecosystem and regional perspective since these species have limited movements as compared to the major tuna species.

The lengths distributions and the reference points obtained from length frequencies for the small tuna species in the Task II database, pooled by species, year and Atlantic region are plotted in **SMT-Figures 3a, b**. To avoid growth overfishing, catch length compositions should consist of fish at a size at which the highest yield from a cohort occurs (Lopt). While to avoid recruitment overfishing, catches should comprise almost exclusively mature individuals (i.e. fish be >L50, the length at which 50% of fish are mature). Two reference points based on Task II data were used, i.e. Popt and P50, the proportion of individuals in the catch size data that are greater than Lopt and L50, respectively. However, Lopt is based on a per recruit analysis which ignores recruitment dynamics, for example the age/size structure and the distribution of a population which all determine productivity and hence sustainability and the formulation of robust management advice.

These data are replotted in **SMT-Figures 4a and b** as an example of how they could be used as indicators of growth and recruitment overfishing. For example if Lopt is used as a target with a probability of 0.5 and a tolerance of ±0.25 to allow limited fluctuations around the target; then in **SMT-Figure 4a** green indicated that length compositions meet this target and red when exceeded. For recruitment overfishing, if 0.6 is used as a limit for P50, then any catches where less than 40% are mature fish are coloured red (**SMT-Figure 4b**). The plots show that in most cases poor yield optimization is occurring, but that recruitment overfishing is not. Although in two cases (WAH in the southern Atlantic and LTA in the North Atlantic) recruitment overfishing has increased in the recent period.

The reliability of such indicators could be examined using management strategy evaluation (MSE), a benefit of this is that MSE can also account for sampling error, which can be substantial for many data limited fisheries.

In 2017, the Ecological Risk Analysis (ERA) was updated for the small tuna caught by longline and purse seine fisheries in the Atlantic. The study found that the top 3 stocks at risk in the Atlantic Ocean that should deserve most of the managers' attention were *E. alleteratus, A. solandri* and *S. cavalla* (**SMT-Table 3**). The update indicated that BRS was no longer designated at high risk and has been listed as at moderate risk.

Given the social and economic importance of the Atlantic bonito, the Committee also recommends this species as a priority for assessment.

#### SMT-5. Outlook

In the absence of any quantitative assessment, there is no projection made by the Committee.

Additional work is being carried out under the SMTYP to address knowledge gaps as regards size data and biological parameters, which are necessary for their assessment.

The Committee notes that the tropical tunas tagging programme adopted by ICCAT continued successfully tagging LTA and WAH.

As part of its 2018 workplan, the Committee will identify potential management procedures and management performance measures for high-priority small tuna stocks in preparation for the start of the development of management strategy evaluation for these species.

#### SMT-6. Effect of current regulations

There are no ICCAT regulations in effect for small tunas. Several regional and national regulations are in place.

#### SMT-7. Management recommendations

The provision of robust management advice by the SCRS relies on accurate reporting of Task I and II data. However, due to the nature of small tuna fisheries (i.e. multi-gear, multi-species, artisanal fisheries, etc.), information on fisheries data is difficult to collect. Therefore, the Committee has not been able to conduct any quantitative stock assessment for any of the small tunas stocks. The Committee has developed indicators, however, their robustness still need to be evaluated before they can be used to provide management advice to the Commission.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0<br>0<br>7<br>1046<br>0<br>362<br>0<br>0<br>15403                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0<br>0<br>1<br>13<br>196<br>0   

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0<br>0<br>0<br>435<br>0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0<br>7<br>1046<br>0<br>362<br>0<br>0<br>15403                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0<br>0<br>435<br>0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0<br>435<br>0                                                                                                                                                | 196<br>0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0<br>0<br>15403                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 15403                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                | 6282                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 6102                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 5900                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | õ                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0
